

Panel 2 - Digitalisation in Aviation

Moderator: Jean-Marc Cluzeau

Your safety is our mission.

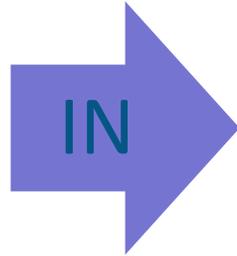

→ **ERICK FERRANDEZ**

→ **EASA, Head of Safety Intelligence and Performance Department & Data4Safety Programme Manager**

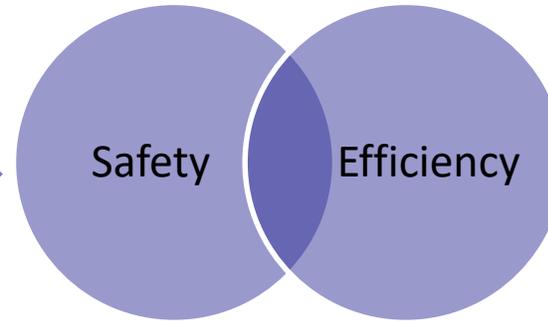

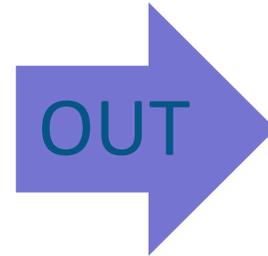

Big Data: What impact in the aviation system?

Expert Knowledge

Data4Safety Programme

Connect Safety Intelligence with actions

Know where to look

See it coming

Act!

Better regulation

Appropriate resources

Data Technologies

Data4Safety Founding Members

AESA, Airbus, Boeing, British Airways, DGAC France, EASA, easyJet, ECA (European Cockpit Association), IAA (Irish Aviation Authority), Iberia, Lufthansa, Ryanair, UK CAA

→ **FRÉDÉRIC SUTTER**

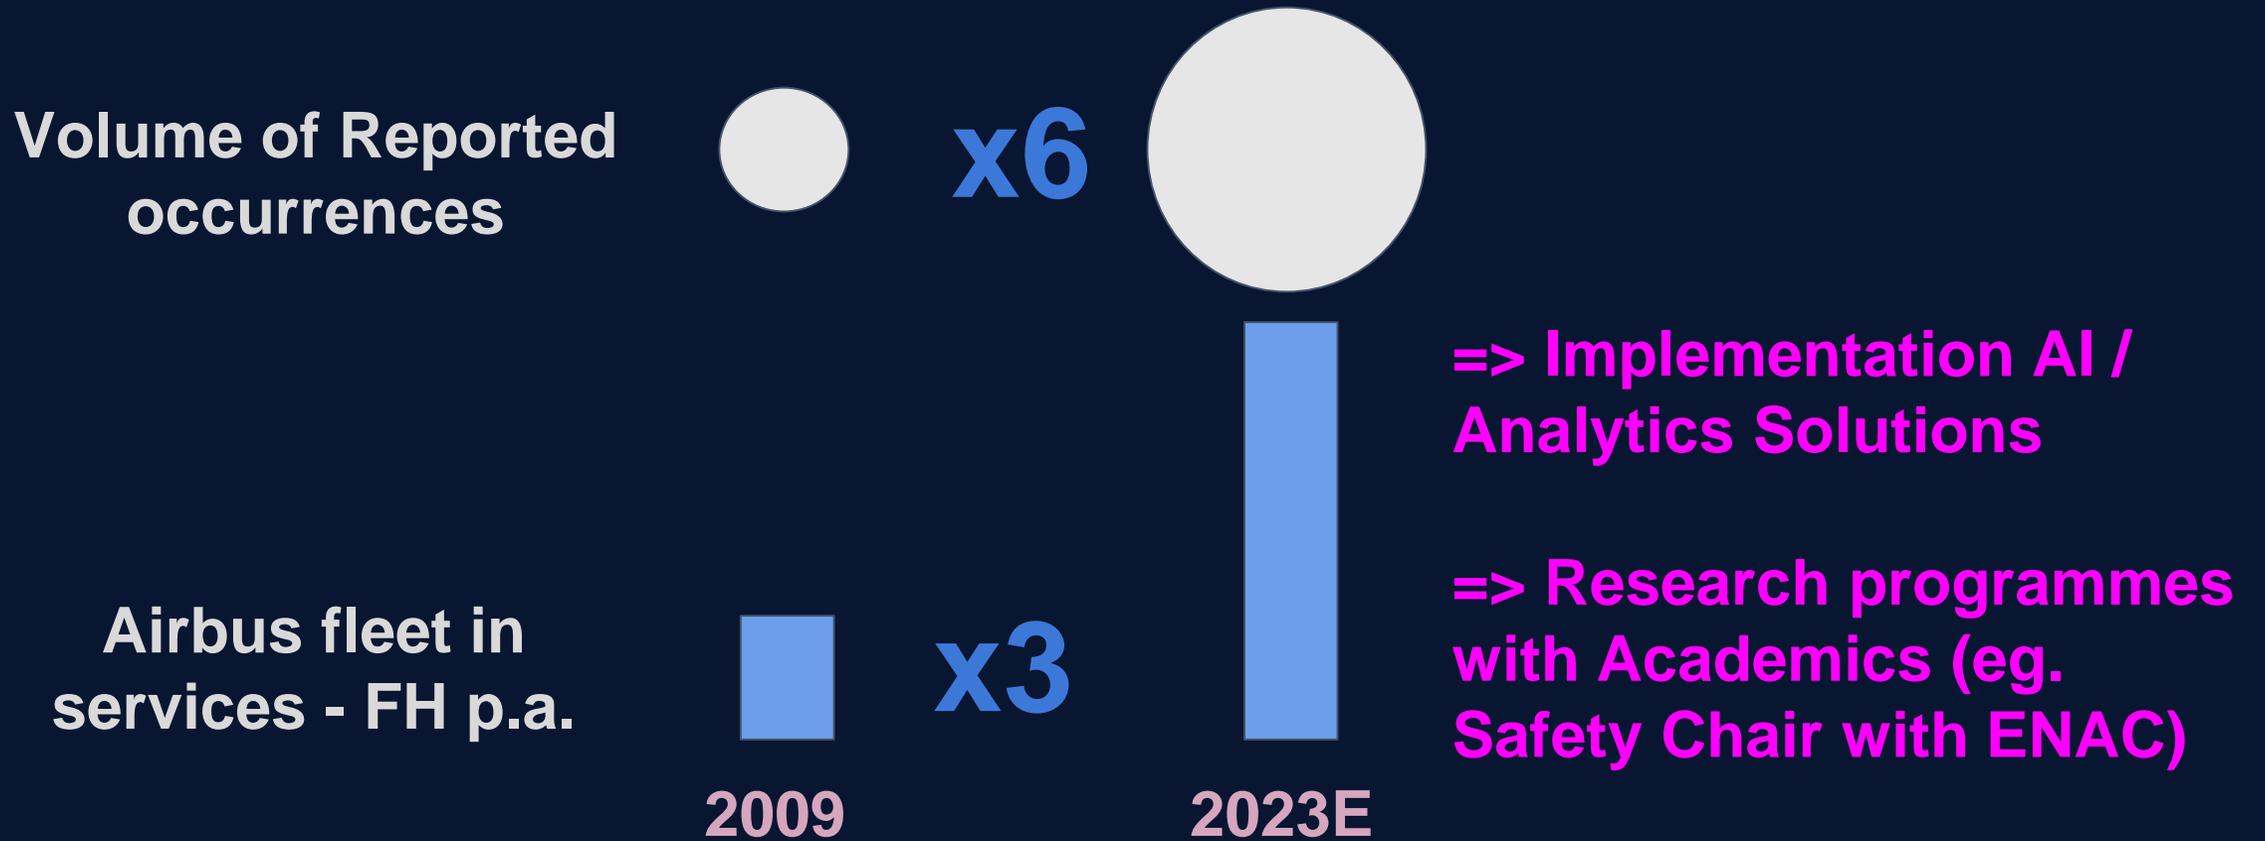

→ **Airbus, Digital Transformation Leader**

EASA Safety Conference

Frederic Sutter

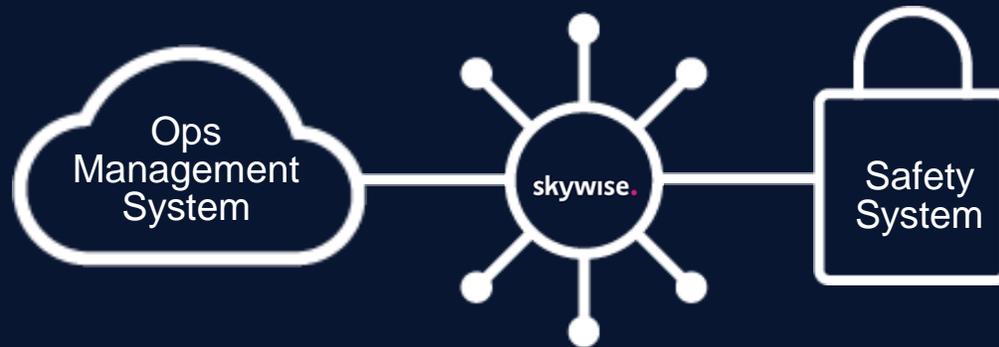

Digital Transformation Leader, Airbus

AI models and advanced analytics are a MUST to address growth of in-service fleet and reported occurrences

🔍 Airlines Safety Teams are already using Big data/Skywise

- Monitor and analyse Safety events
- Transparent and objective reporting system
- Internal collaboration while maintaining crew confidentiality

E.g.:

- Simple automated reporting (eg. numbers / trends of higher severity safety events automation)
- Investigations facilitations (eg. Pre-matching AQD reports with FDM events and other operational data)
- Reports and links across airport, aircraft, etc. => good tooling (vs excel, tableau)

Aviation Industry could Foster further Collaboration around flight ops data

Get sufficient volume of data and (exhaustivity!) via more reporting or access to existing database to develop Text Mining/Machine Learning

Enable better data fusion from various sources (aircraft, weather, ATM...) to improve root cause analysis and better anticipation

Big data platforms getting scale in the industry to support data sharing across stakeholders and simplify data collection & sharing burden for airlines

→ JEAN JOURDAN

→ **Thalès, Chief Technical Officer, Business Line Airspace Mobility Solutions**

Panel #2 Digitalisation in Aviation

4th November 2019
EASA annual conference
Helsinki

Traffic growth

Airspace becomes a rare resource

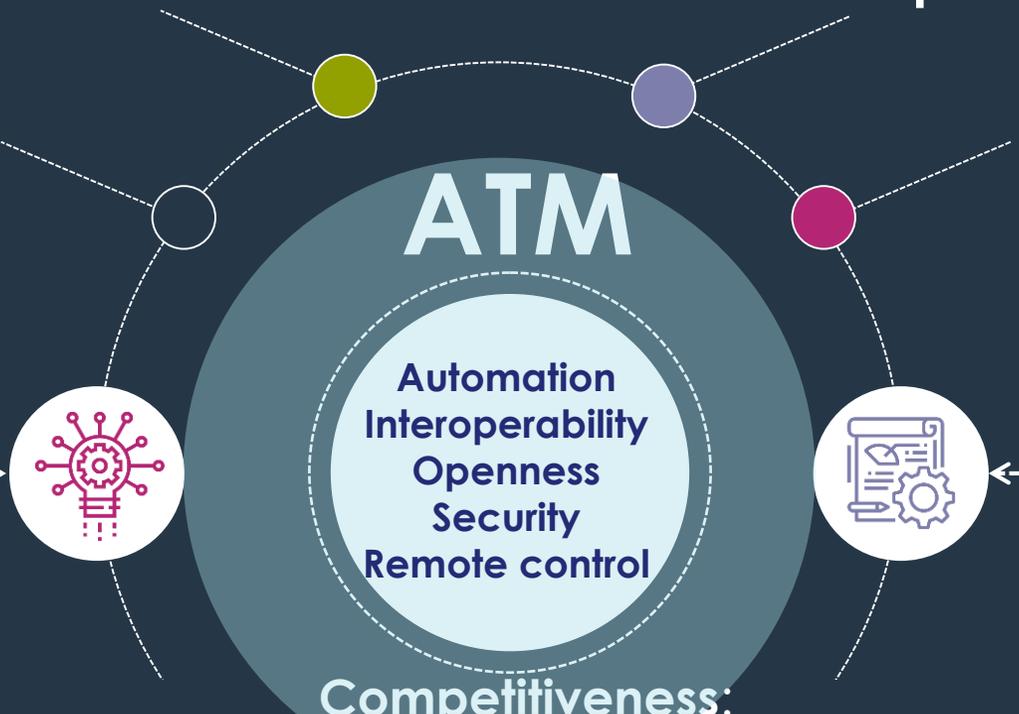

Environment footprint

Complex mobility flows
incl. new vehicles

New technologies

Digital (AI, Big Data)
Open data
Connectivity
Virtualisation

Authority pressure
increase
Regulation

XAI

Disruptive Safety approach
Stochastic approach

→ *Breakthrough issue*

Black box

Current Safety approach
Service experiences
Lifecycle mismatch

→ *Not anymore sustainable*

Glass box

Classical Safety approach
Full DO compliance

→ *Competitiveness issue*

ATM domain requires new safety paradigms now

Roadmaps on Digital Aviation Perspectives

AVIATION PLATFORMS

- From aviation data platform to interoperable operational platform and digital virtual ATM system

SAFETY CONSTRAINTS

- Disruptive safety paradigms to enable new perspectives

OPERATIONAL BENEFITS

- Operational business perspectives with AI

OPERATIONAL BENEFITS

Resilience monitoring
Weak signal analysis, ML based anomaly detection

Airspace complexity
Workload assessment, optimal allocation, Environment footprint assessment

Support to ATCO
Efficiency, pressure assessment

Conflict resolution
quickly identify possible solution to solve conflicting traffic

Traffic forecast
Optimised ETA, ETO, CTOT
Weather event forecast

Robustness improvement
Infinite testing capacity, permanent testing, better coverage, hundred millions of validation tests

Current ATM operational platform

Open ATM operational platform
Safety critical interoperability means

ATM Digital Twin platform
What-if test benches, simulation, training

Real Time ATM Digital Twin platform
Safety, security, real time constraints

AVIATION PLATFORMS

Classical safety approach
Engineering judgement
Failure approach focused on hazards analysis

Improved safety method
All discovered hazards based on weak signals analysis

Dual safety approach
Augmented safety with operators advices
(decision aids tools integrating Data validity domain)

Non Interference Analysis safety method
Failure approach focussed on critical chains augmented with integrity controls

Improved safety method
Failure approach enhanced with success cases

Unified safety approach
Classical safety evidences + XAI explanation for digital computation to support Safety case of Digital automation

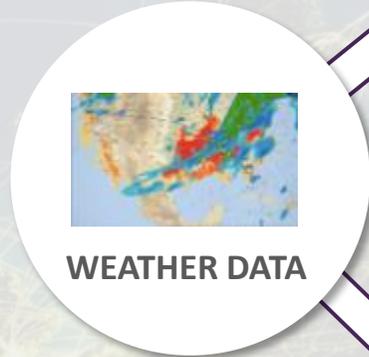

SAFETY CONSTRAINTS

→ **PIERRE JOUNIAUX**

→ **Safety Line, Chief Executive Officer**

BIG DATA

TO IMPROVE SAFETY
AND EFFICIENCY OF
AVIATION
OPERATIONS

DATA SCIENCE IN THE COCKPIT

- Speeds
- Altitudes
- Weights

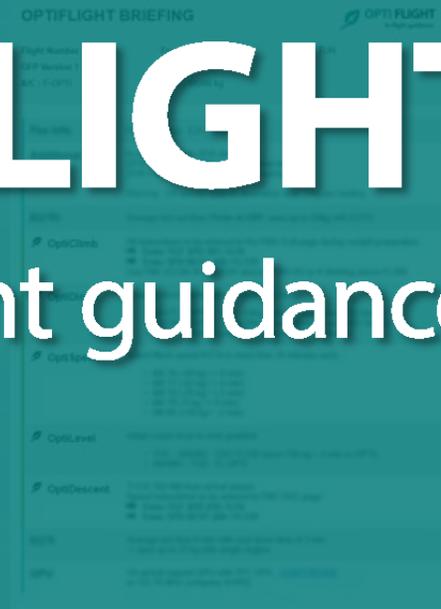

Optimization
Loop

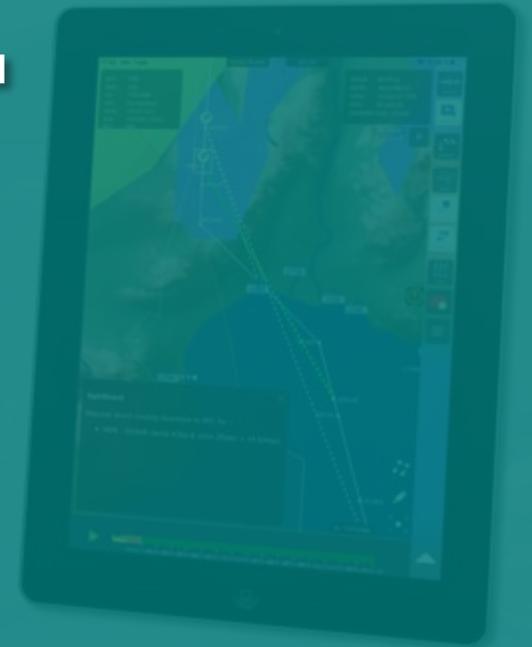

OPTI FLIGHT

In-flight guidance

OPTI FLIGHT BRIEFING

COMPATIBLE WITH 

WEATHER APP

ECO-FRIENDLY TAXIING

Push back
with an operator
disconnected from the aircraft

and look for their way (mistakes !!)

Air Traffic Controller
manages all the aircraft on the ground - Visual separation, transmitted by voice

Marshaller
undergoes the arrival of aircraft with availability and efficiency issues

AIRSIDE WATCH

Radar Data at work

AIRSIDE WATCH
Radar data at work

ECO-FRIENDLY TAXIING

Pushback

with an operator connected/
disconnected from the aircraft

Pilots follow the ATC instructions

and look for their way (mistakes !!)

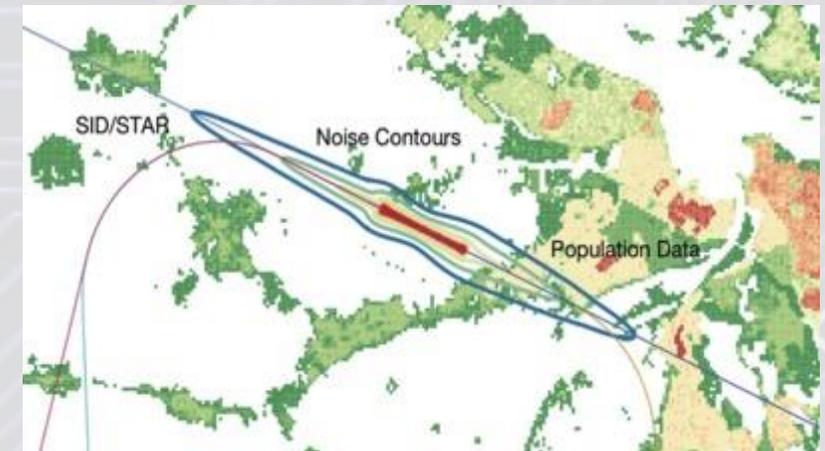

Air Traffic Controller

manages all the aircraft on the
ground - Visual separation,
transmitted by voice

Marshaller

undergoes the arrival of aircraft
with availability and efficiency
issues

AIRSIDE WATCH

Radar data at work

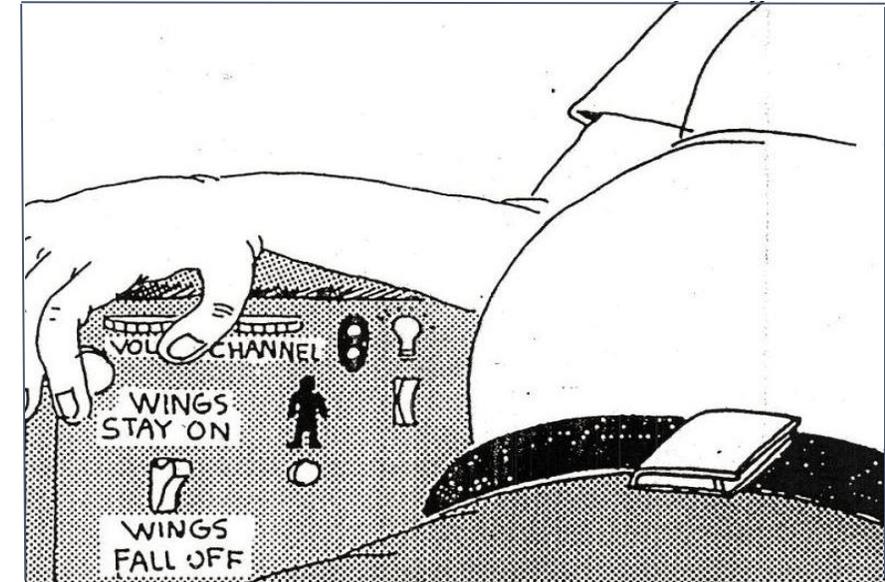

→ **LUUK VAN DIJK**

→ **Daedalean AI, Chief Executive Officer and Founder**

The next century of flying

“Human error
is a symptom of a system
that needs to be
redesigned.”
Dr. Nancy Leveson (MIT).

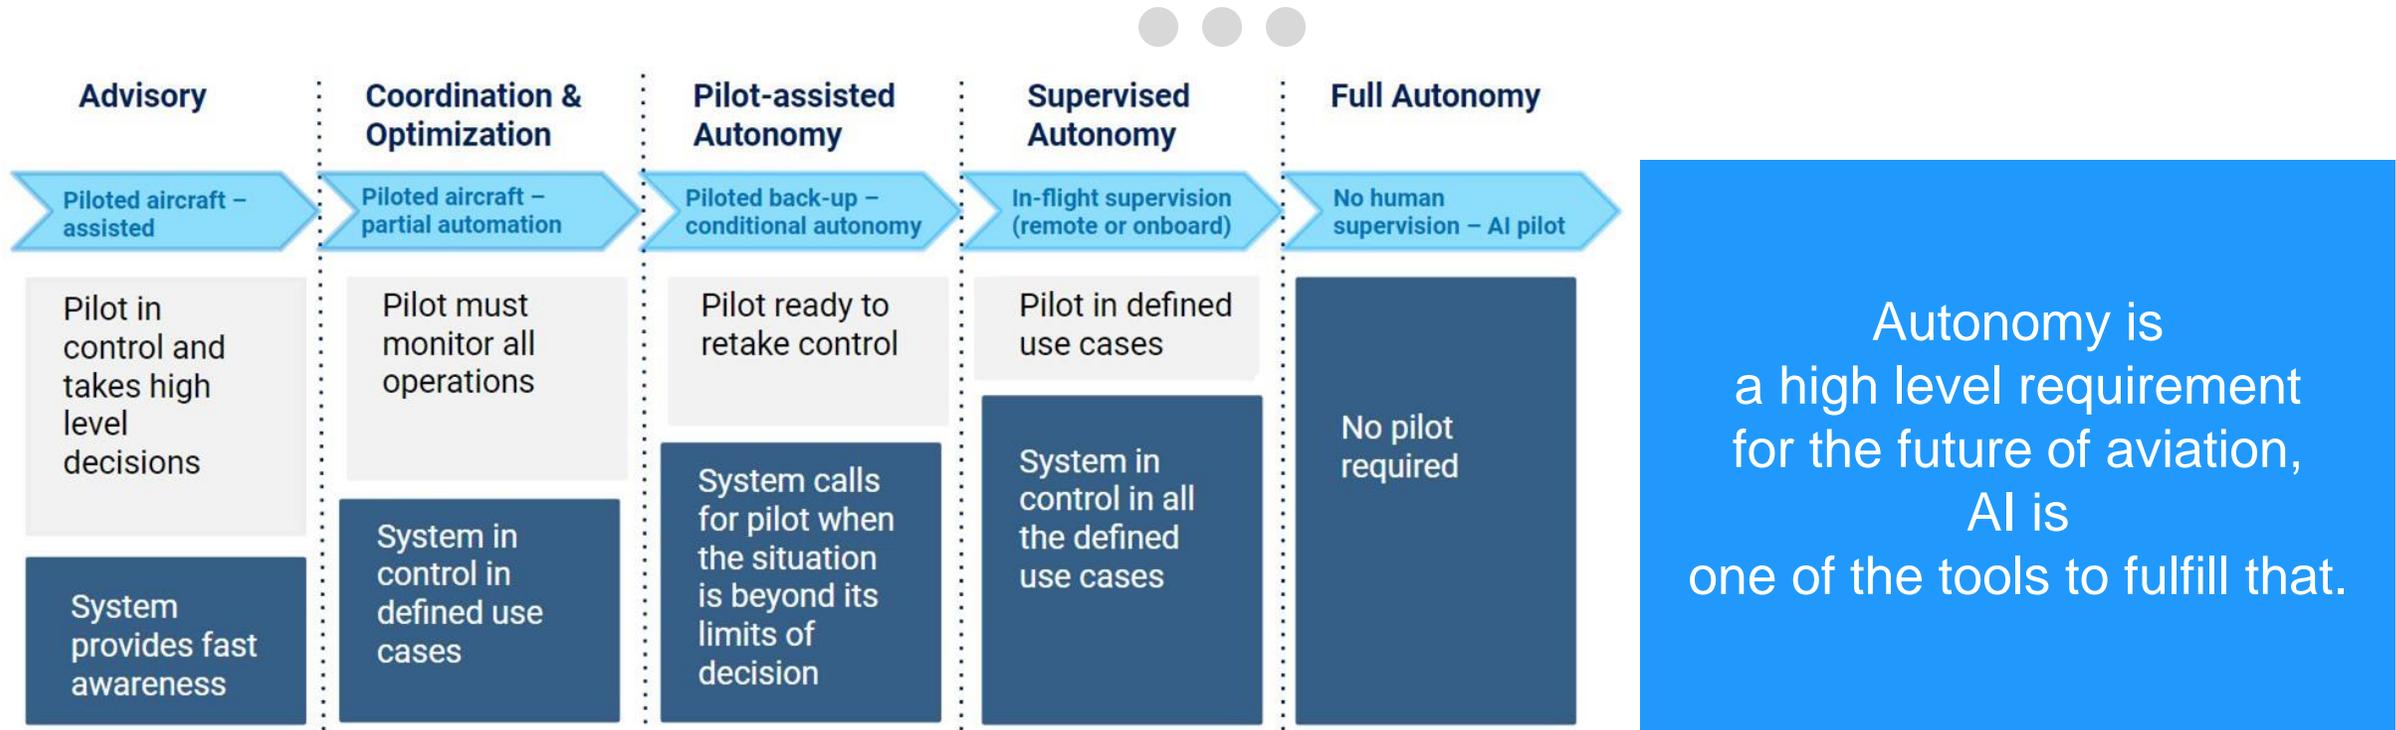

New challenges

higher density use of airspace

And new risks

human is the new weakest link

Automation, autonomy and safety

Autonomy is a high level requirement for the future of aviation, AI is one of the tools to fulfill that.

It's a sliding scale

lower layers – automation, higher layers – autonomy

Opportunities now

autonomy is the *conditio sine qua non* in the near future
