Electric Propulsion Penalties

Energy Storage Weight (50x worse than aviation fuel)
Energy Storage Cost (Tesla 65 kWh battery is ~\$25,000)
Certification Uncertainties and Absence of Standards

Electric Propulsion Benefits

~2x efficiency of turbine engines, 3-4x efficiency of piston engines
High efficiency across >50% rpm range
6x the motor power to weight of piston engines
None air breathing - No power lapse with altitude or on hot days
Extremely Quiet
Zero vehicle emissions
10x lower energy costs

Electric Propulsion Integration Benefits

Scale independence of efficiency and power to weight
Power to weight and efficiency don't degrade at smaller sizes
Extremely compact
High reliability – few moving parts

First ever 2-seat
electric airplane

Safety related to energy storage

Enclosures, care, fire hazards of batteries vs. fuel.

Systems integration & Intercommunication.

Making everything sing together, databus - how and why.

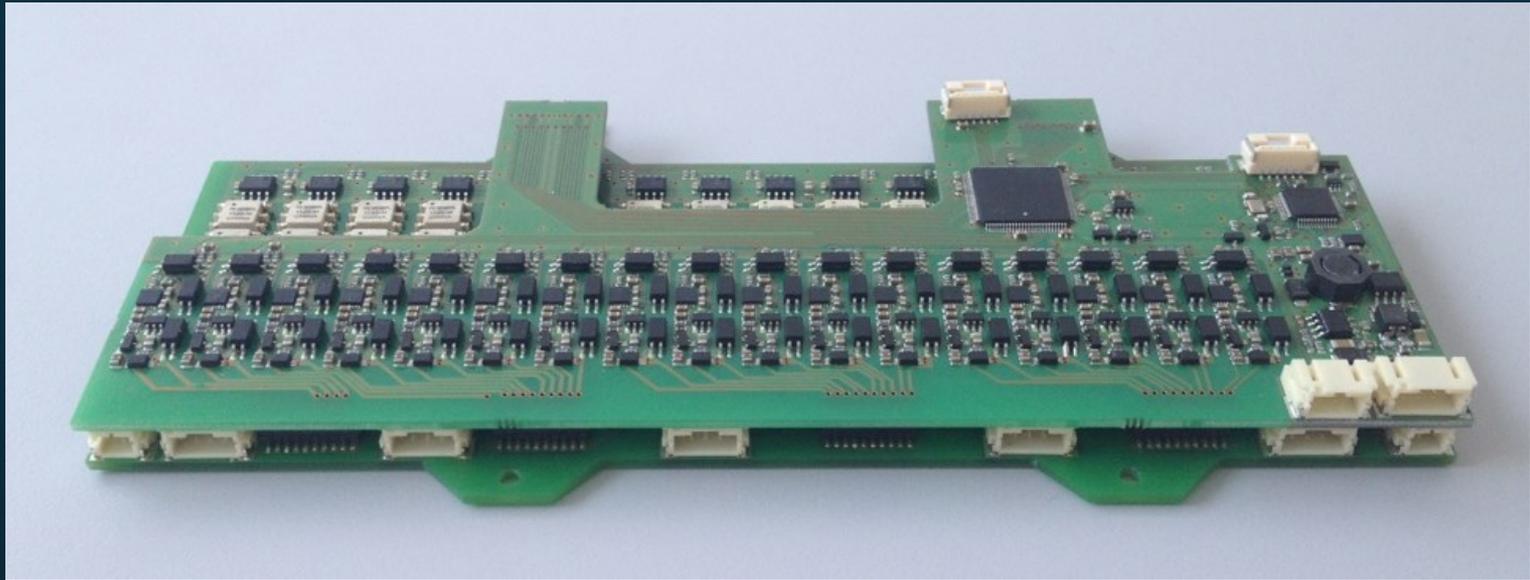

Software Certification and HMI.

Battling the data jungle. Knowledge proliferation.

BMS.

Pipistrel's proprietary BMS features, including cell failure forecasting.

Active voltage balancing & BMS integration in Battery System

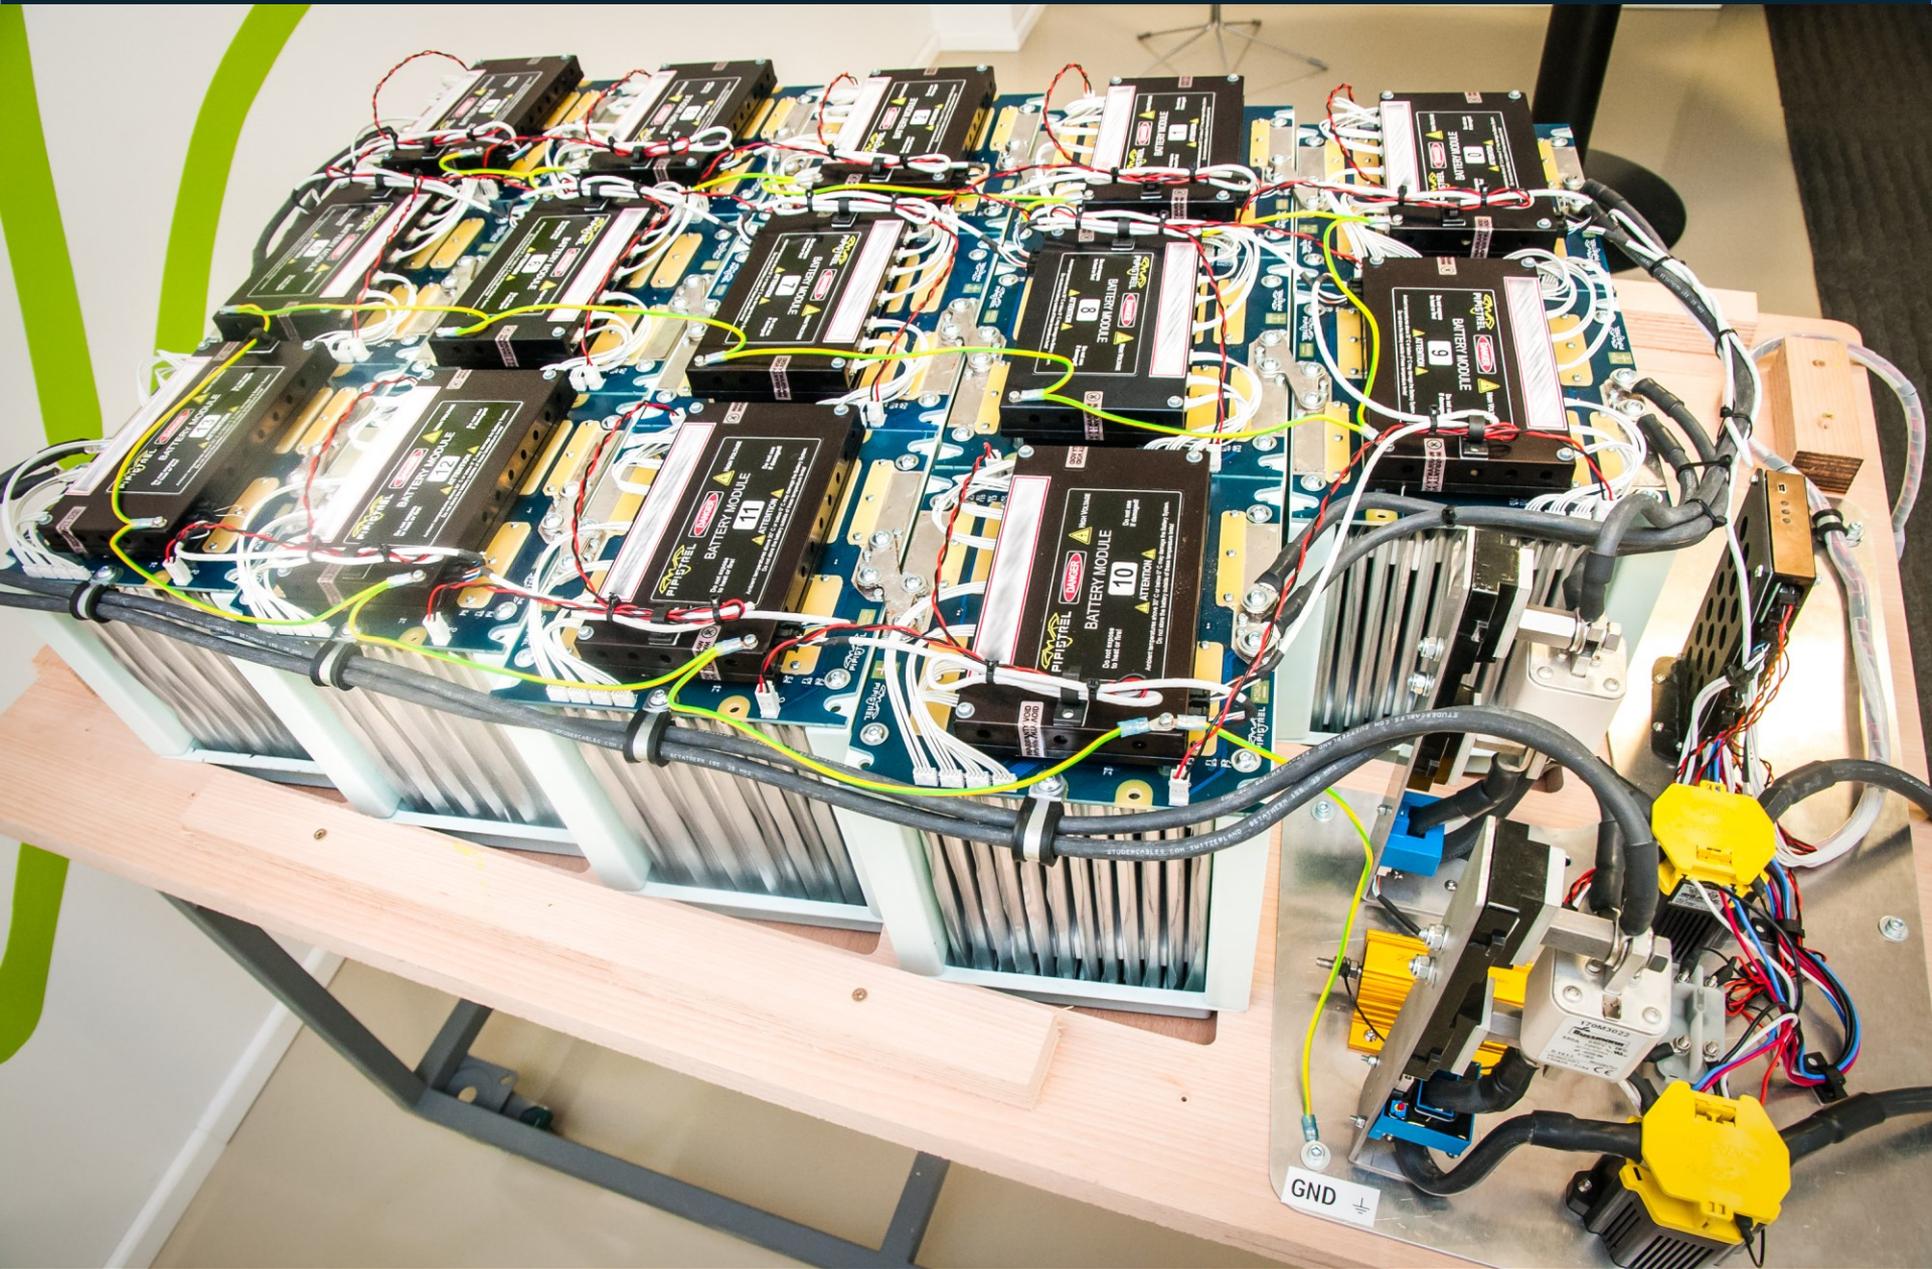

Active cell voltage balancing much faster, more efficient, safer than passive. Effectively increases battery capacity. Can utilize broad voltage spectrum 3.0 - 4.2 V safely.

Keeping cell voltage balanced also while charging

Reduces time from plug-in to flight. Tolerance for delta-voltage between cells is 0.03 V.

Individual cell failure model-based prediction

Monitoring behavior of all cells, all the time, serves as input to the cell failure prediction algorithm. Know when your cell will fail in advance.

What is the future?

How do we get there?
