

# Towards a service to assist mitigation of ash cloud impact on aviation?

Gerald Braun & Thomas Bouvet  
IASCC, Cologne  
09/09/1010

1. Presentation approach
2. Review of user needs
3. Data collection options
4. Service example
5. The IAP programme
6. FlySafe: Avian alert system

# Review of major needs & requirements

---

## NEEDS

**Pre-eruption warning**

**Early detection of ash cloud**

**Monitoring & quantitative  
characterization of ash cloud**

Critical need to  
characterize the  
**source**

Quantitative Now -  
Forecasting of ash cloud

## REQUIREMENTS

When: How long before?

What: Geographical location / Intensity prevision?

Performance: Level of reliability required?

When? Within 3h of eruption outset,  
including during night time?

What? Geographical location / depth / height

Performance: Accuracy required (m)?

When? Update every 3-6h?

Maximum delay between measurement and  
reception of readily usable information by end user?

What: Position / height / horizontal and vertical extent

Source strength (ash outflow rate)

Particle concentration

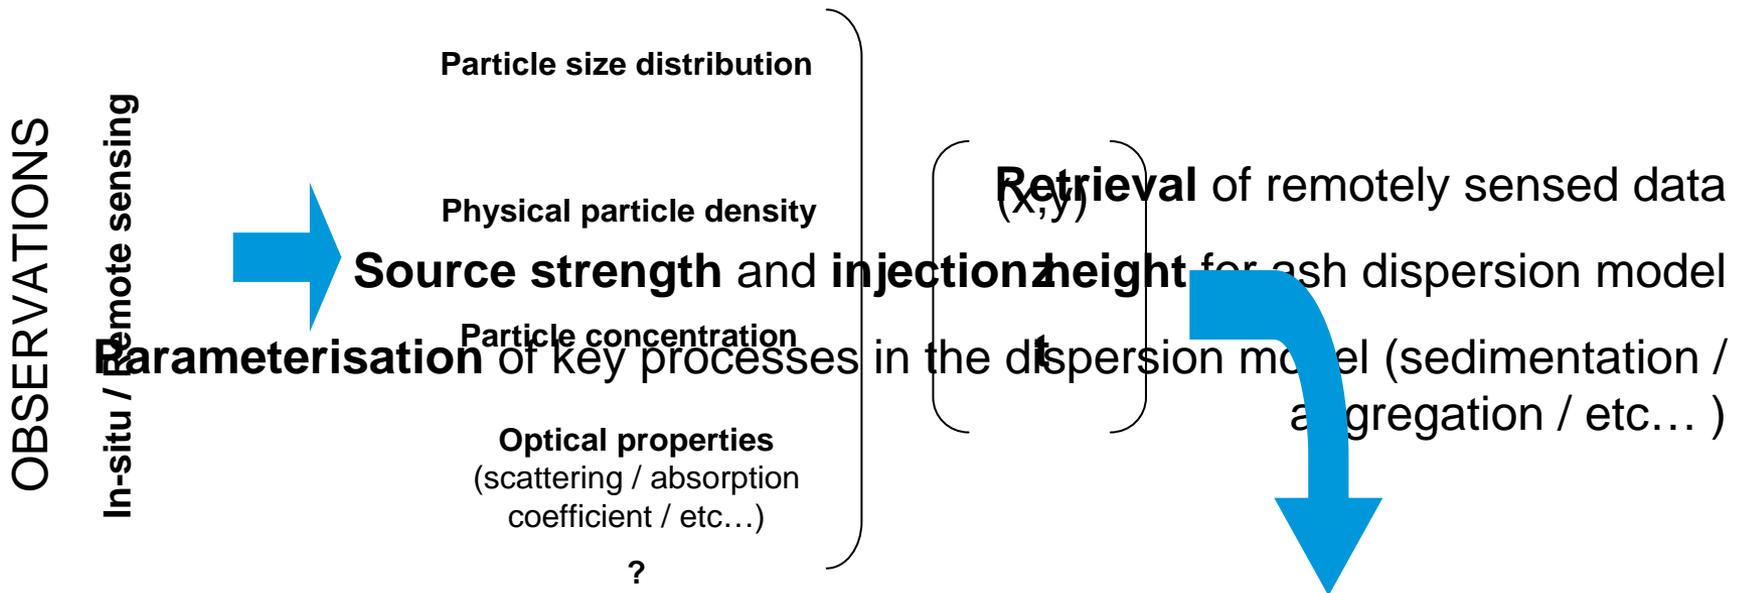

Particle size distribution & optical properties

Performance: Vertical / horizontal resolution?

Accuracy of measurement?

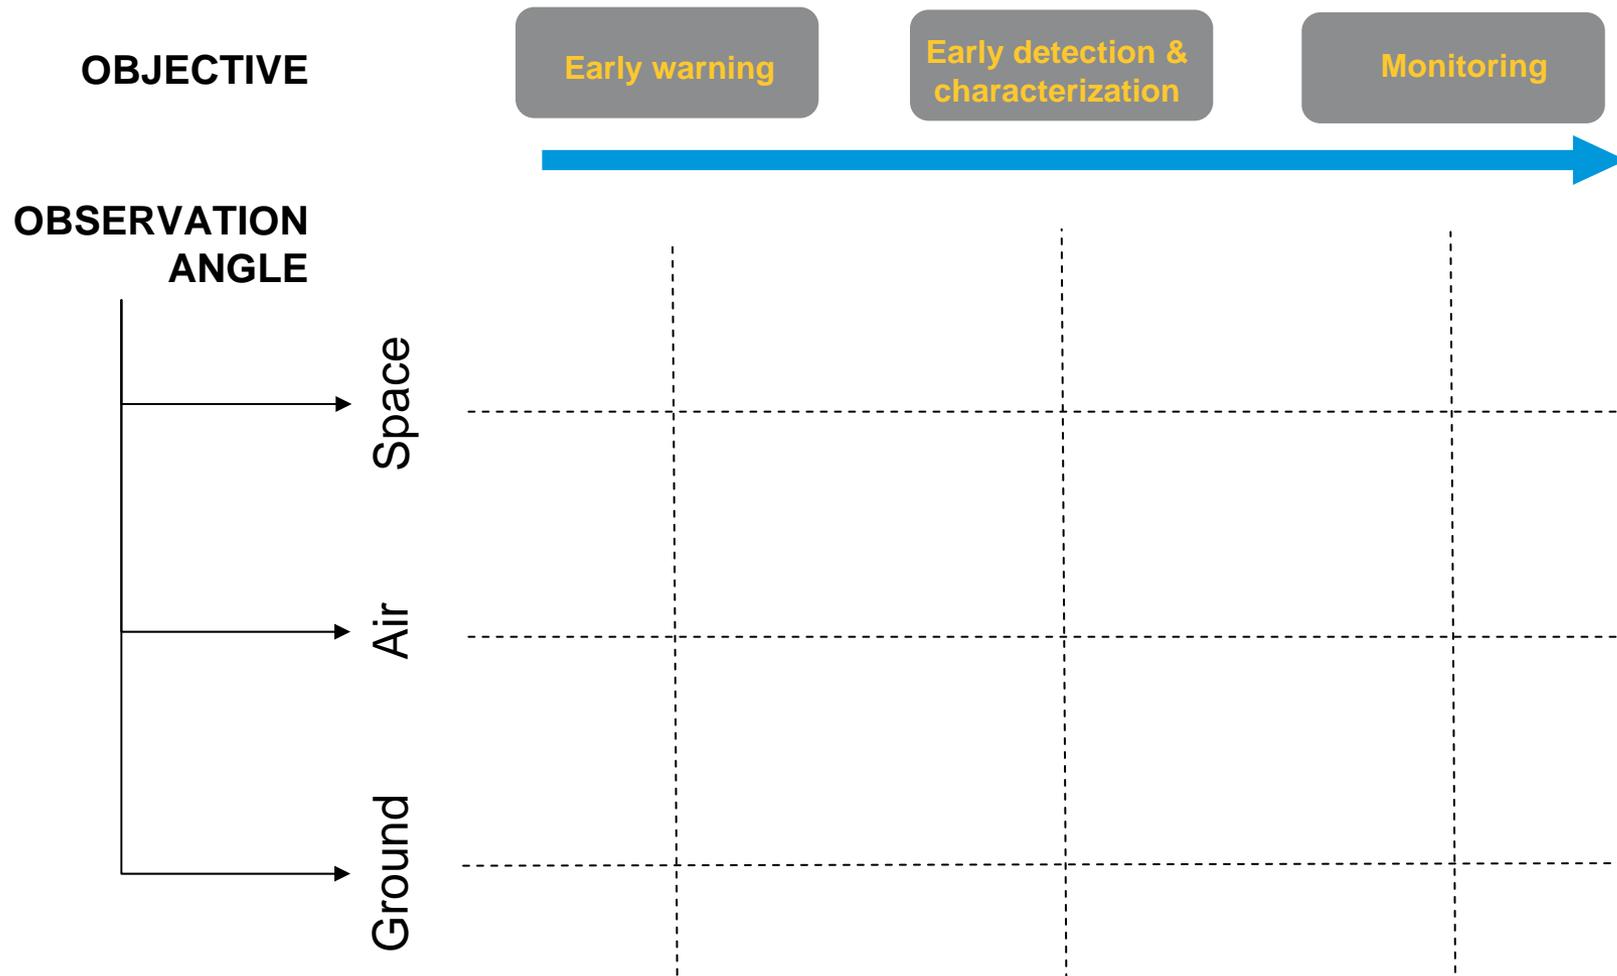

## Significance of source quantitative characterization

### Source characterization: Why?

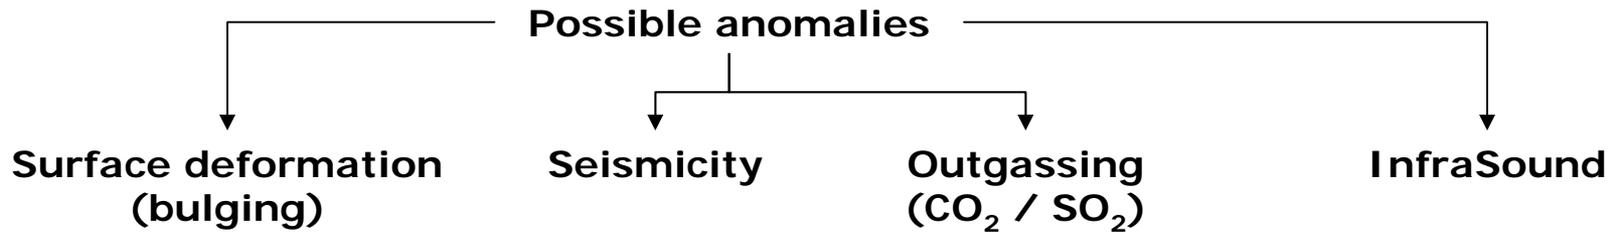

# Data collection: Possible options

## Reference matrix

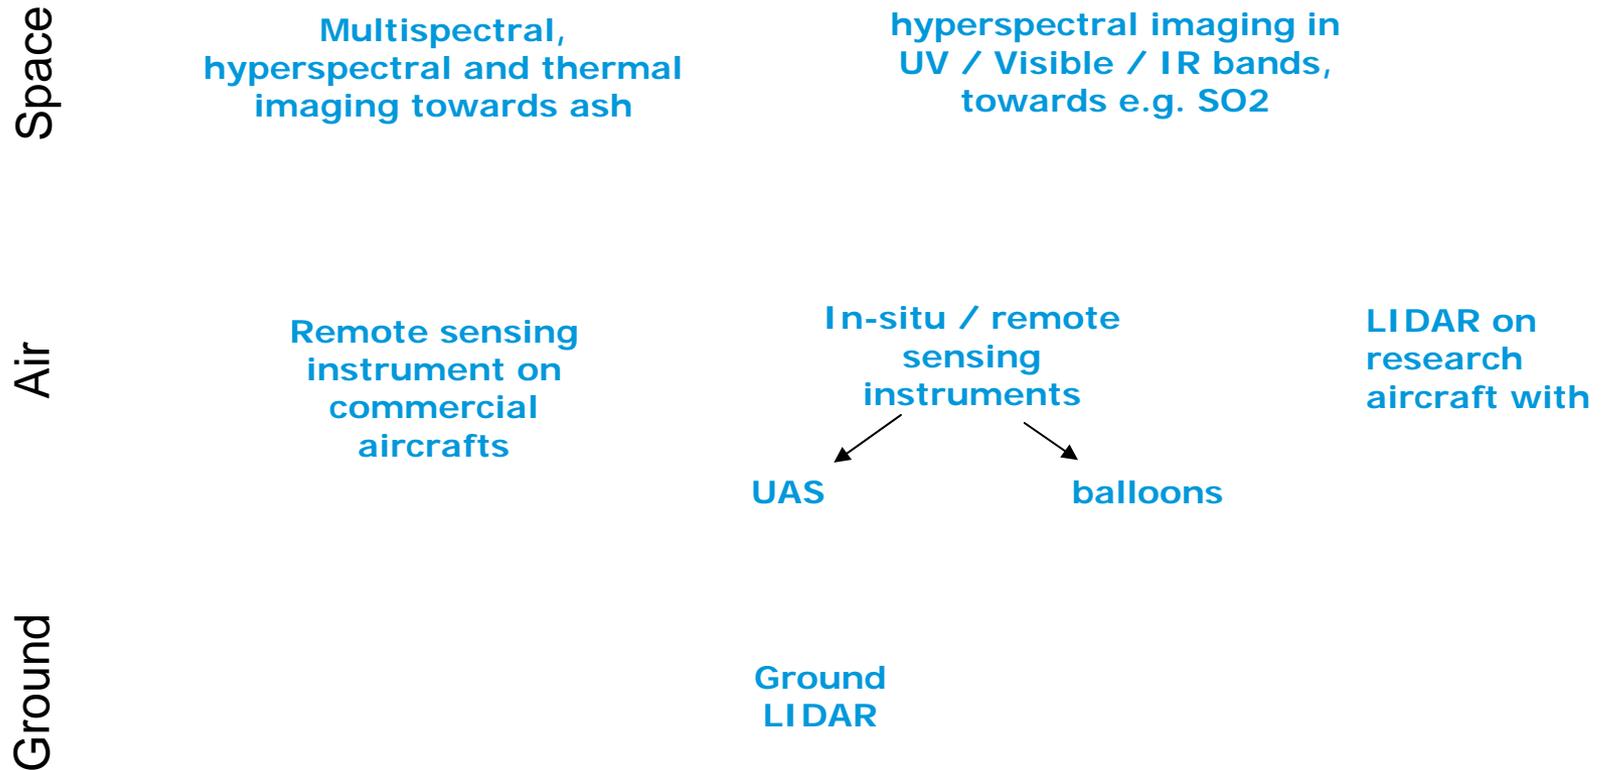

# Data collection: Possible options

## Early warning

# Data collection: Possible options

## Early detection / characterization

# Data collection: Possible options

## Monitoring

Space

Retrieval of vertical integrated ash column (TIR)

Retrieval of e.g. SO<sub>2</sub> integrated column (Visible / UV / TIR)

Air

In-situ / remote sensing instruments

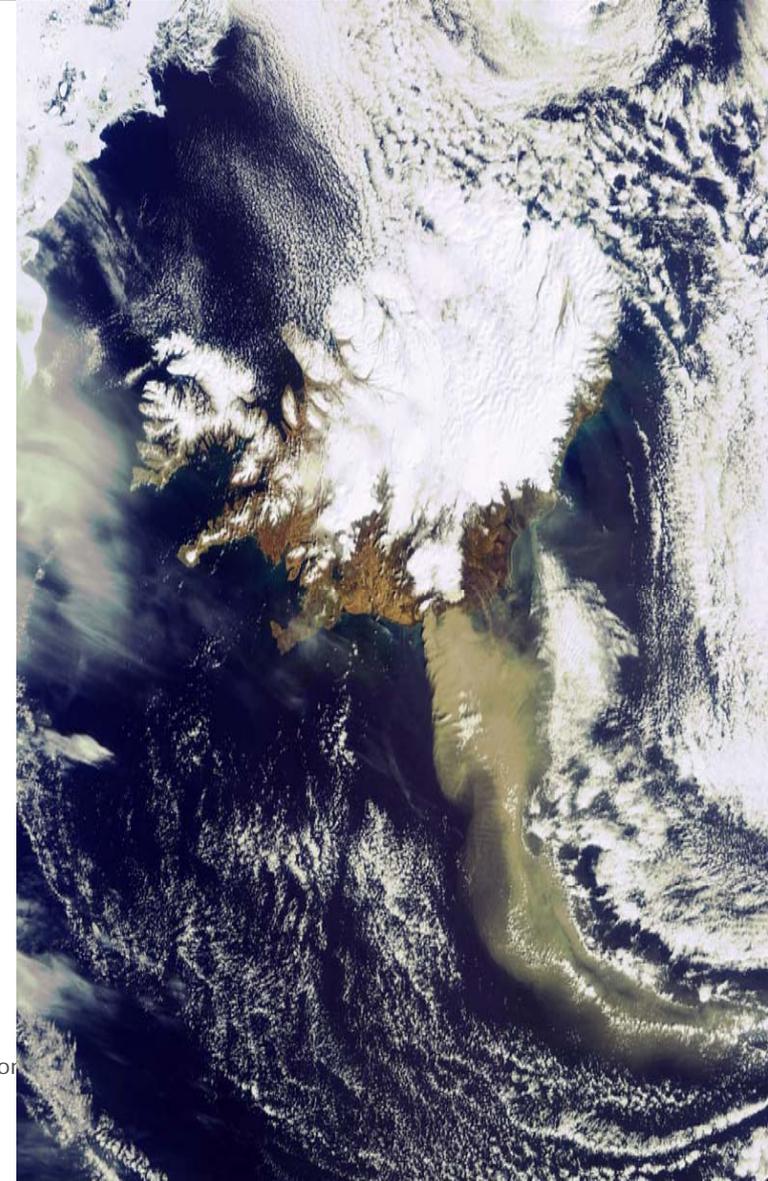

LIDAR on research aircraft

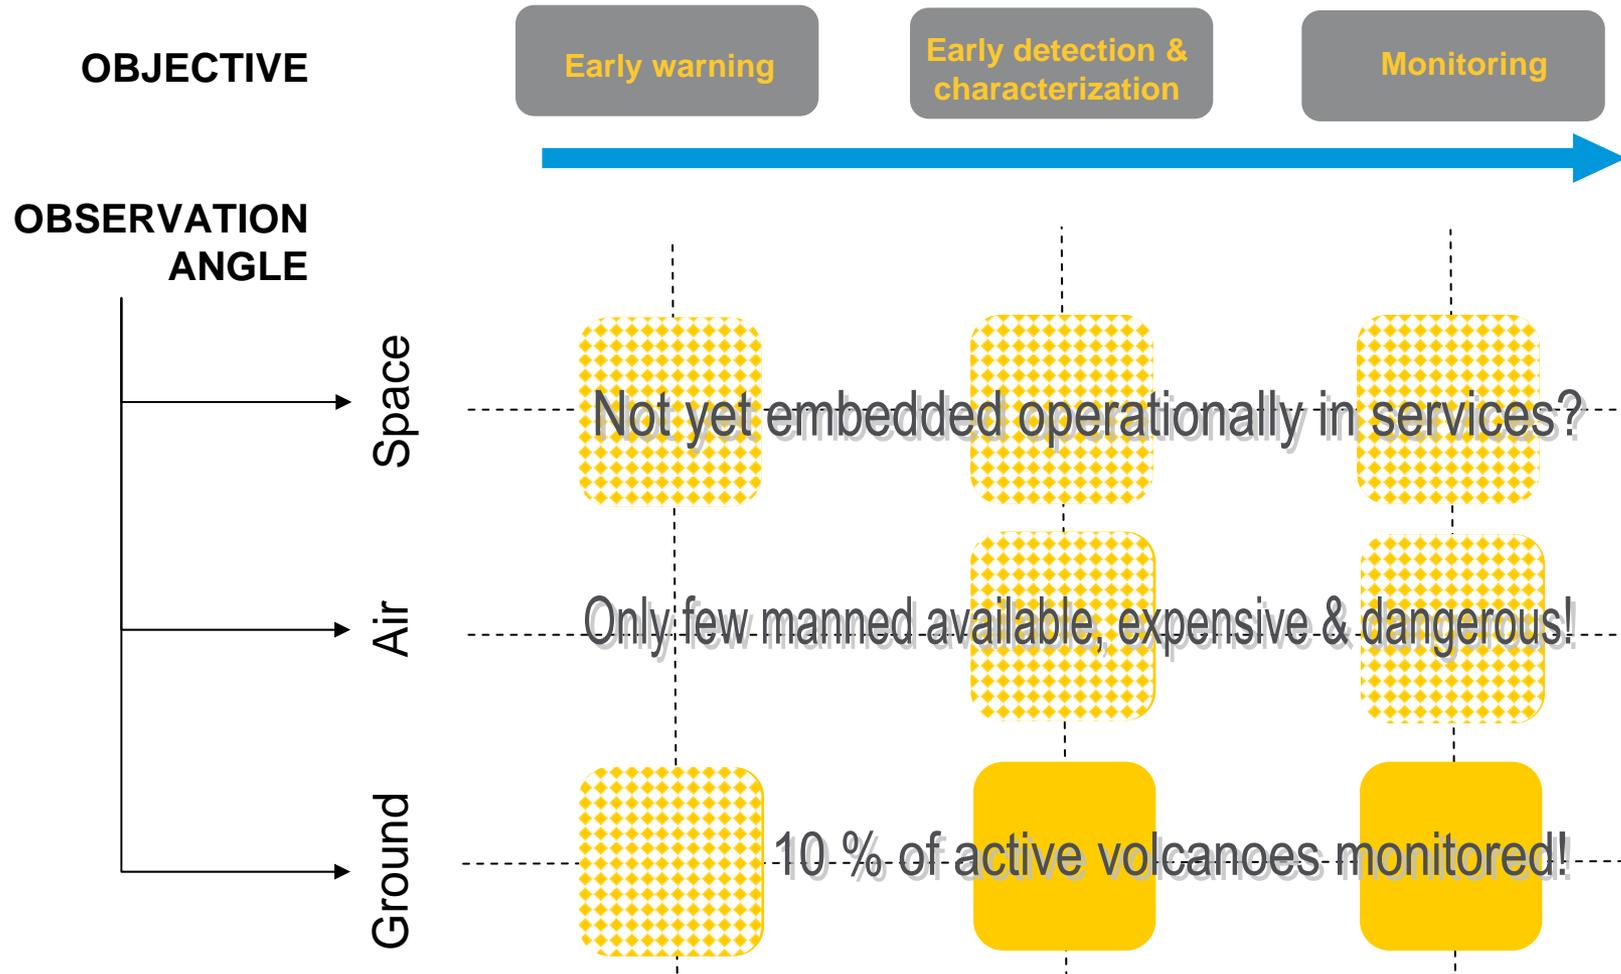

UAS

balloons

Ground

Ground LIDAR

**Integrated approach is needed** to provide the right data at the right time!

**Problem:** Aircrafts and ground based assets are very expensive to procure and operate

**A relevant solution?**

# Example of a potential service

## Functional elements

**Volcano** routine monitoring

**Volcano** pre-eruption surveillance

**Ash cloud** early characterization & monitoring

**Space** data retrieval & analysis

Anomaly alert

**Ground** based instrumentation

- Deployment / installation
- Operation
- Info retrieval & analysis

**Air** borne instrumentation

- Deployment / installation
- Operation
- Info retrieval & analysis

Eruption alert

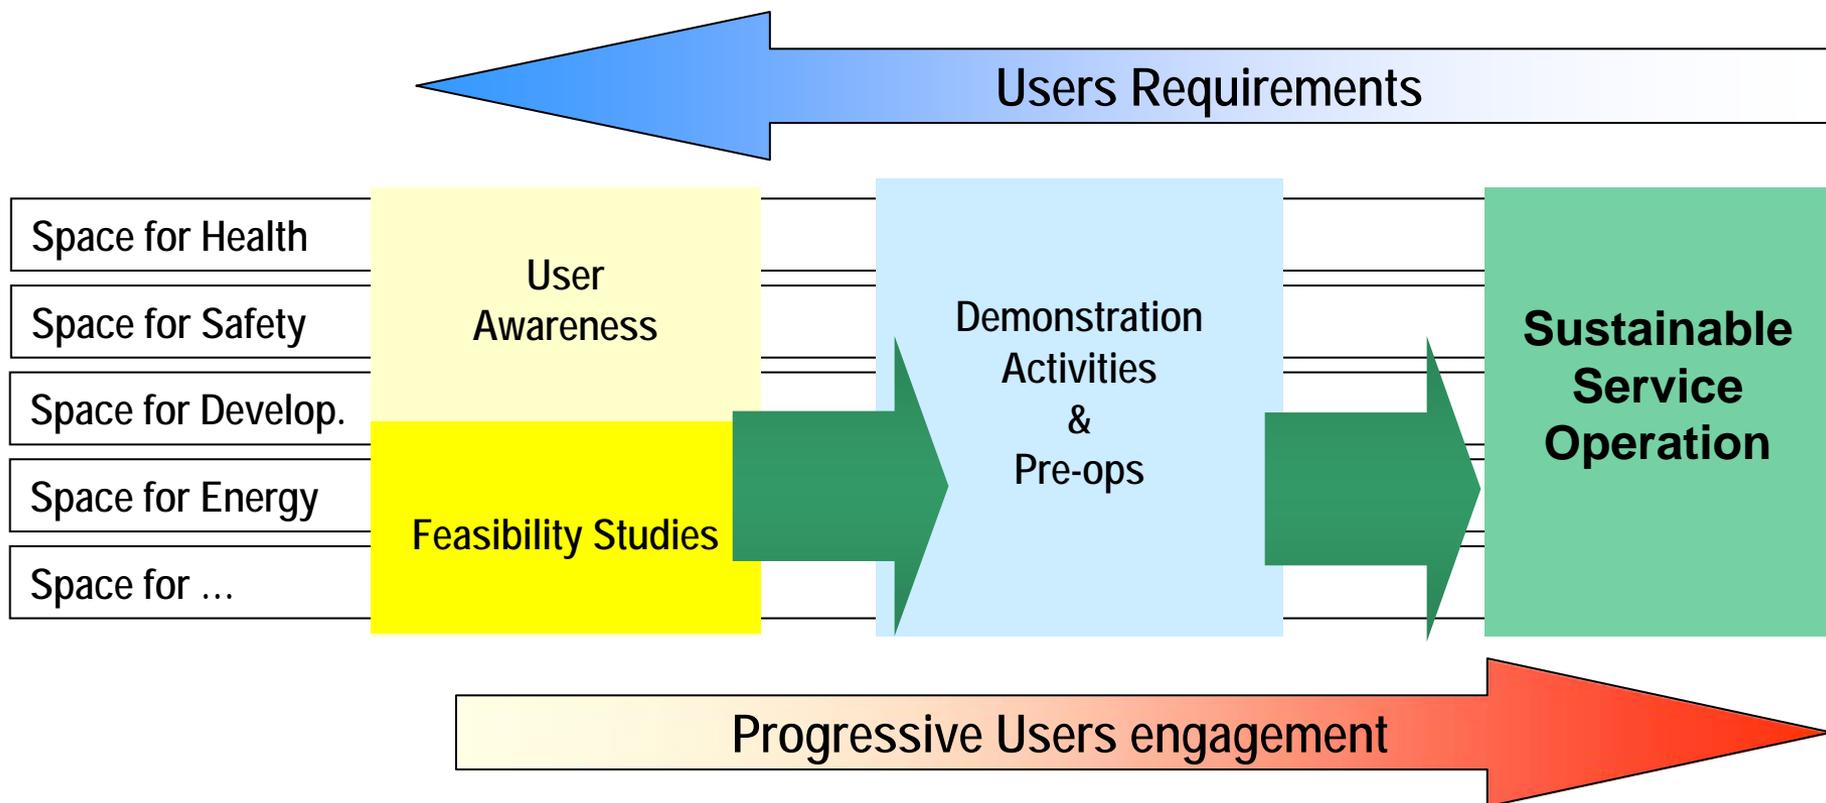

Coordination / data integration

standardization of data input – product output / quality assurance

**Exploit systematically the extended **use of space** capacity and **capability** through the development, in close **partnership with end-users**, of integrated applications which can **demonstrate** a potential for user-side **sustainable services**.**

**“Connecting expert Communities  
&  
Combining Technologies”**

# Integrated Application Promotion Programme Structure

**Awareness Activities:** Understand, foster and organise stakeholder demands.

**Feasibility Studies:** Assess technical and economic viability of services.

**Demonstration Projects:** Implement pre-operational services in partnership with users.

- ✓ **Financing** & management of feasibility studies and demonstration projects
- ✓ Activities are aimed at setting up **OPERATIONAL end-to-end** services
- ✓ The system architecture is composed of **mature elements**. Only minor pre-operational developments needed (in particular at interfaces)
- ✓ The service should leverage on **more than one space asset** (among SatEO, SatNAV, SatCom). Space assets are typically integrated with terrestrial assets within the system architecture

# Integrated Application Promotion FlySafe Avian Alert System

## Yearly economical Impact of Bird Strikes

1. German Air Force (1997-2004): **360** collisions
2. French Air Force (1998-2005): **320** collisions
3. Royal Air Force **110** documented serious accidents until 2004
4. Estimated conservative cost due to damage and delays of **commercial aircraft worldwide 1.2 billion USD**

# Integrated Application Promotion FlySafe Avian Alert System

## FlySafe objectives:

Improve flight safety & increase flight operation time in northwest Europe by:

- Improving existing bird route detection
- Reducing human dependency
- Developing bird forecast models
- Developing tools for bird flight activity detection at and near airports
- BIRDTAM Cross border harmonization

## FlySafe activities:

Started 2007

Partners:
