EXECUTIVE SUMMARY

The objective of this Notice of Proposed Amendment (NPA) is to support general aviation (GA) in Europe by reducing the administrative burden for the embodiment of simple changes and repairs in certain aircraft when applying the acceptable methods, techniques, and practices defined in CS-STAN, and thus to promote safety.

Taking into account the principles of efficiency and proportionality, this NPA proposes to amend CS-STAN in order to:

— introduce new standard changes and update some existing ones; and
— introduce new standard repairs and update some existing ones.

The changes introduced by this NPA are based on lessons learned and proposals submitted by affected stakeholders, as well as technological innovations from the industry, which can bring safety benefits in a cost-efficient manner.

Overall, this is expected to bring a moderate safety benefit, to have no social or environmental impacts, and may provide major economic benefits by reducing the regulatory burden for the embodiment of simple changes and repairs in certain aircraft.

Action area: General aviation
Affected rules: CS-STAN
Affected stakeholders: Operators other than airlines; maintenance organisations (MOs); and maintenance engineers or mechanics
Driver: Efficiency/proportionality
Impact assessment: None
Rulemaking group: No
Rulemaking Procedure: Standard

1. About this NPA

1.1. How this NPA was developed

The European Aviation Safety Agency (EASA) developed this NPA in line with Regulation (EU) 2018/1139\(^1\) (hereinafter referred to as the ‘Basic Regulation’) and the Rulemaking Procedure\(^2\). This rulemaking activity is included in the EASA 5-year Rulemaking Programme\(^3\) under rulemaking task RMT.0690.

This NPA is based on the ‘systematic rulemaking projects’ concept introduced into the European Aviation Safety Agency’s Management Board Decision No 18-2015 of 15 December 2015. This concept is intended to improve the efficiency of the EASA rulemaking process.

A considerable number of proposals for these proposed amendments to CS-STAN have been submitted by stakeholders during the consultation of NPA 2014-24 ‘Certification Specifications for Standard Changes & Standard Repairs (CS-STAN) — Phase 1\(^4\)’, NPA 2016-17 ‘Regular update of certification specifications for standard changes & standard repairs (CS-STAN)\(^5\), and later on through rulemaking proposals\(^6\), the CS-STAN dedicated reporting tool\(^7\) and through other channels (e.g. the GA Road Map, emails).

EASA assessed all these proposals, taking into account the principles of efficiency and proportionality, as well as safety impacts.

The text of this NPA has been developed by EASA.

It is hereby submitted to all interested parties\(^8\) for consultation.

1.1.1. The structure of this NPA and related documents

Chapter 1 of this NPA contains the procedural information related to this task.

Chapter 2 (in summary — why and what) explains the core technical contents.

Chapter 3 contains the proposed text for the amendment of CS-STAN.

This NPA does not require a regular impact assessment (RIA).

---

\(^2\) EASA is bound to follow a structured rulemaking process as required by Article 115(1) of Regulation (EU) 2018/1139. Such a process has been adopted by the EASA Management Board (MB) and is referred to as the ‘Rulemaking Procedure’. See MB Decision No 18-2015 of 15 December 2015 replacing Decision 01/2012 concerning the procedure to be applied by EASA for the issuing of opinions, certification specifications and guidance material (http://www.easa.europa.eu/the-agency/management-board/decisions/easa-mb-decision-18-2015-rulemaking-procedure).

\(^3\) http://easa.europa.eu/rulemaking/annual-programme-and-planning.php

\(^7\) https://www.easa.europa.eu/contact-us

\(^8\) In accordance with Article 115 of Regulation (EU) 2018/1139, and Articles 6(3) and 7 of the Rulemaking Procedure.
1.2. **How to comment on this NPA**

The deadline for submission of comments is **11 December 2018**.

1.3. **The next steps**

Following the closing of the public commenting period, EASA will review all comments.

Based on the comments received, EASA will develop a decision that adopts new and amends existing Certification Specifications for Standard Changes and Standard Repairs (CS-STAN).

The comments received and the EASA responses to them will be reflected in a comment-response document (CRD). The CRD will be published together with the decision.

---

9 In case of technical problems, please contact the CRT webmaster ([crt@easa.europa.eu](mailto:crt@easa.europa.eu)).
2. In summary — why and what

2.1. Why we need to change the rules — issue/rationale

The initial issue of CS-STAN was adopted on 8 July 2015, and it contained a limited number of standard changes and standard repairs (SCs/SRs). The number of published standard changes and repairs increased in 2017 with the publication of ED Decision 2017/014/R (CS-STAN Issue 2)\(^{10}\).

Nevertheless, the development of CS-STAN, including its regular update, remains a core element of the EASA strategy to support GA.

In this NPA, EASA proposes new or amended standard changes and standard repairs, as defined in points 21.A.90B and 21.A.431B of Annex I (Part 21) to Regulation (EU) No 748/2012\(^{11}\).

The ultimate goal is to support the operation of GA aircraft in Europe by reducing the regulatory burden for the embodiment of simple changes and repairs in certain aircraft when applying the acceptable methods, techniques, and practices.

2.2. What we want to achieve — objectives

The overall objectives of the EASA system are defined in Article 1 of the Basic Regulation. This proposal will contribute to the achievement of the overall objectives by addressing the issues outlined in Chapter 2.1 of this NPA.

The specific objectives of this NPA are to support GA in Europe by reducing the administrative burden for aircraft modification/repair, and to promote safety.

2.3. How we want to achieve it — overview of the proposals

The new and amended standard changes/repairs proposed with this NPA contain acceptable methods, techniques, and practices for identifying and carrying out standard changes and standard repairs for embodiment in certain aircraft without a design approval.

The most significant changes proposed by this NPA are listed hereafter:

**SUBPART A**

— **CS STAN.05 CS-STAN Embodiment of current SC/SR (new)**

Since several existing standard changes/repairs are subject to amendments/improvements as part of the CS-STAN evolution process, this new paragraph has been introduced to provide further guidance regarding the validity of standard changes/repairs that were embodied on the basis of superseded versions (i.e. when requirements were less demanding).

Additionally, it clarifies that new aircraft modifications must always be made on the basis of the latest available version of CS-STAN.

— **CS STAN.80 Definitions and Abbreviations (amended)**

Definitions and abbreviations have been amended to include the new terms introduced by this NPA.

---

\(^{10}\) https://www.easa.europa.eu/document-library/agency-decisions/ed-decision-2017014r

SUBPART B

— **CS-SC002c — Installation of Mode S elementary surveillance equipment (amended)**

This SC has been amended to clearly allow for the individual installation of an altitude encoder. Additionally, the purpose of this SC has been expanded to further clarify that the installation of traffic awareness beacon system (TABS) equipment by means of this SC is not sufficient to permit the pilot to fly into transponder mandatory zones (TMZs).

— **CS-SC003c — Installation of audio selector panels and amplifiers (amended)**

This SC has been amended to limit its scope in order to prevent certain newly available functions from seriously affecting the pilot–machine interface.

— **CS-SC005a — Installation of an ADS-B OUT system compliant with AMC 20-24 (new)**

This new SC has been introduced to allow the installation of ADS-B OUT systems that are compliant with AMC 20-24.

— **CS-SC006a — Installation or activation of an ADS-B system for airborne awareness (new)**

This new SC has been introduced to allow the installation or activation of an ADS-B system for airborne awareness. The ADS-B system is installed or activated on a no-hazard/no-credit basis.

— **CS-SC034b — Exchange of an existing battery for a Lithium Iron Phosphate (LiFePO4) battery system (amended)**

This SC has been amended to update the reference to a superseded standard.

— **CS-SC035a — Installation of solar cells on sailplanes (new)**

This new SC has been introduced to allow the installation of solar cells on sailplanes, with the purpose of allowing longer operation of the on-board avionics systems.

The installation of solar cells may be a means to provide recharging of the existing batteries when flying in sunny conditions, thus extending the possible flight time.

— **CS-SC036a — Installation of visual awareness lights (new)**

This new SC has been introduced to allow the installation of visual awareness lights.

A mid-air collision is one of the most common reasons for accidents in the GA domain\(^{12}\). Many existing (old) airframes are only partly, or not at all, equipped with these lights. This new SC is expected to incentivise the retrofitting of old GA airframes to install awareness lights in an acceptable and controlled way, thereby enhancing flight safety.

— **CS-SC037a — Exchange of a main aircraft battery (new)**

This new SC has been introduced to allow the exchange of a main aircraft battery (e.g. a starter battery, batteries for sailplanes) for another type that meets the same minimum standards.

In comparison with originally certified batteries, it is recognised that modern battery systems may feature:

- improved leakage protection;
- higher capacity, also in low outside air temperature (OAT) conditions;
- better flammability values; and
- lower weights.

\(^{12}\) Refer to the European Plan For Aviation Safety (EPAS) 2018-2022, point 5.5.4
All the above aspects are expected to bring positive contributions to safety.

- **CS-SC038a — Installation of DC to DC converters (new)**
  This new SC has been introduced to allow the installation of direct current (DC) to DC converters to support avionics installations and equipment that require a supply from a controlled voltage.

- **CS-SC051c — Installation of ‘FLARM’ equipment (amended)**
  This SC has been amended to improve the wording and to include two FLARM requirements in paragraphs 3 and 4.

- **CS-SC052c — Installation of GNSS equipment (amended)**
  This SC has been amended to highlight that the installation of a simple GPS system is covered by this SC. Further clarifications have been added in paragraphs 3 and 4.

- **CS-SC058b — Installation of traffic awareness beacon system (TABS) equipment (amended)**
  This SC has been amended to provide additional clarifications with respect to the risk class of the TABS.

- **CS-SC084a — Repainting of composite aircraft structures (new)**
  This new SC has been introduced to allow the repainting of the outer surfaces of composite aircraft with alternative varnishes of the acrylic or polyurethane paint types.

- **CS-SC085a — Exchange of an aircraft livery paint and decorative sticker scheme (new)**
  This new SC has been introduced to allow a full or partial change of an aircraft external livery design.

- **CS-SC086a — Exchange of a balloon ‘bottom-end’ (new)**
  As it is very common in the balloon community to use one bottom-end, comprising a basket and heater system, together with multiple envelopes, this new SC has been introduced to allow for such a combination.

- **CS-SC105a — Installation of mounting systems to hold equipment (new)**
  This new SC has been introduced to allow the installation of structural provisions intended to hold pilot’s equipment inside the cockpit or the cabin.

- **CS-SC106a — Installation of flight time recorders (new)**
  This new SC has been introduced to allow the installation or exchange of flight time recorders without affecting other aircraft systems or installing new data acquisition points.

- **CS-SC107a — Installation of carbon monoxide detectors (new)**
  This new SC has been introduced to allow the installation of carbon monoxide detectors, either as panel-mounted devices, or by the semi-permanent installation of ‘life saver’ badges by using adhesives.
  This device is expected to increase the overall level of safety.

- **CS-SC151b — Installation of headrests (amended)**
  This SC has been amended to improve the wording in order to prevent any misunderstandings regarding its applicability.
2. In summary — why and what

- **CS-SC152b — Changes to seat cushions including the use of alternative foam materials (amended)**
  This SC has been amended to provide additional clarifications and details regarding the acceptable methods, techniques, and practices to be followed in order to embody such changes.

- **CS-SC201b — Exchange of powerplant instruments (amended)**
  This SC has been amended to improve the wording.

- **CS-SC206a — Exchange of fixed pitch wooden propellers (new)**
  This new SC has been introduced to allow the exchange of fixed wooden propellers on ELA2 aeroplanes.
  Such an exchange is possible as a Standard Change because a vibration test is not required according to the Certification Specification for fixed wooden propeller installations (refer to CS XX.907).

- **CS-SC207a — Exchange of hot-air balloon fuel cylinders (new)**
  This new SC has been introduced to allow the exchange of the fuel cylinders in hot-air balloons.

- **CS-SC401c — Exchange of basic flight instruments (amended)**
  This SC has been amended to expand its scope to include the possibility of replacing the aircraft clock. Additionally, the applicability has been amended for reasons of clarity.

**SUBPART C**

- **CS-SR802c — Repair of sailplanes including powered sailplanes, LSA and VLA (amended)**
  This SR has been amended to expand the list of acceptable references to be used for repairs of light-aircraft structures.

**2.4. What are the expected benefits and drawbacks of the proposals**

No impact analysis has been conducted, as this NPA has been prepared in the framework of a regular update of CS-STAN in line with Article 3(5) of EASA MB Decision No 18-2015.
3. **Proposed amendments and rationale in detail**

The text of the amendment is arranged to show deleted text, new or amended text as shown below:

— deleted text is struck through;
— new or amended text is highlighted in grey;
— an ellipsis ‘[…]’ indicates that the rest of the text is unchanged.

3.1. **Draft certification specifications (draft EASA decision)**

CS-STAN is amended as follows:

**SUBPART A — GENERAL**

[...]

**CS STAN.05 Embodiment of current SCs/SRs**

As CS-STAN evolves, some SCs/SRs are amended, and their revision status is increased (e.g. CS-CS.XXXa is replaced with CS-CS.XXXb). In this respect, the new SC/SR version (in the example SC-CS.XXXb) is the only one that is current, and the old SC/SR version (in the example CS-CS.XXXa) becomes not-applicable for new embodiments.

Therefore, the following principles apply:

— It is mandatory to install the SC/SR using the latest revision published.

— Always refer to the revision of the SC/SR in EASA Form ‘123’.

**Note:** A change or repair embodied against an older version of the relevant SC/SR, which was in force at the time of the embodiment, remains valid when a new revision of the SC/SR demands more conditions to be met, unless EASA mandates additional considerations by means of an Airworthiness Directive (AD).

[...]

**CS STAN.80 Definitions and Abbreviations**

[...]

‘DC’ means direct current.
‘GA’ means general aviation.
‘EMI’ means electromagnetic interference.
‘NVG’ means night-vision goggles.
‘SDA’ means system design assurance.
‘SIB’ means safety information bulletin.
‘SIL’ means source integrity level.

[...]

‘TABS’ means traffic awareness beacon system;

A Class A TABS:
— includes the transponder, an altitude source, and ADS-B OUT functionality; refer to ETSO-C199 subparagraphs (1), (2), and (3);
— consists of a Class A device, or a TSO-C112e- and TSO-C166b-compliant device.

A Class B TABS:
— includes the global navigation satellite system (GNSS) position source functionality; refer to ETSO-C199 subparagraph (4);
— consists of a Class B device, or an ETSO-C129a (cancelled), ETSO-C145c or later revision, ETSO-C146c or later revision or ETSO-C196b-compliant GPS.

[...]

SUBPART B — STANDARD CHANGES

LIST OF STANDARD CHANGES

Group Systems — Communication:

CS-SC001a — Installation of VHF voice communication equipment
CS-SC002bc — Installation of Mode S elementary surveillance equipment
CS-SC003bc — Installation of Audio Selector Panels and Amplifiers
CS-SC004a — Installation of antennas
SC-SC005a — Installation of an ADS-B OUT system compliant with AMC 20-24
SC-SC006a — Installation or activation of an ADS-B system for airborne awareness

Group Systems — Electrical:

CS-SC031b — Exchange of conventional Anti-Collision Lights, Position Lights and Landing & Taxi lights by LED-type lights
CS-SC032b — Installation of anti-collision lights
CS-SC033a — Installation of cabin and cockpit conventional lights by LED-type lights
CS-SC034abh — Exchange of an existing battery by for a Lithium Iron Phosphate (LiFePO₄) battery system
CS-SC035a — Installation of solar cells on sailplanes
CS-SC036a — Installation of visual awareness lights
CS-SC037a — Exchange of a main aircraft battery
CS-SC038a — Installation of DC to DC converters

Group Systems — Avionics/NAV/Instruments:

CS-SC051bc — Installation of ‘FLARM’ equipment
CS-SC052bc — Installation of VFR GNSS or GPS equipment
3. Proposed amendments and rationale in detail

CS-SC053b — Installation of Radio Marker Receiving equipment
CS-SC054b — Exchange of Distance Measurement Equipment (DME)
CS-SC055b — Exchange of ADF equipment
CS-SC056b — Exchange of VOR equipment
SC-SC057a — reserved
SC-CS058ab — Installation of traffic awareness beacon system (TABS) equipment

Group Systems — Mechanical and structural:

CS-SC081a — Exchange of tyres (inner tubes/outer tyres)
CS-SC082a — Exchange of skids on wing tips/fuselage tails
CS-SC083a — Exchange of flexible seals on control surfaces
CS-SC084a — Repainting of composite aircraft structures
CS-CS085a — Exchange of an aircraft livery paint and decorative sticker scheme
CS-SC086a — Exchange of a balloon 'bottom-end'

Group Cabin:

CS-SC101b — Installation of emergency locator transmitter (ELT) equipment
CS-SC102a — Installation of DC power supply systems (PSS) for portable electronic devices (PED)
CS-SC103a — Exchange of interior material covering floor, sidewall and ceiling
CS-SC104a — Installation of lightweight in-flight recording systems
CS-SC105a — Installation of mounting systems to hold equipment
CS-SC106a — Installation of flight time recorders
CS-SC107a — Installation of carbon monoxide detectors

Group Survivability Equipment:

CS-SC151ba — Installation of headrests
CS-SC152ab — Changes to seat cushions including the use of alternative foam materials
CS-SC153b — Exchange of safety belts — torso restraint systems

Group Powerplant and fuel systems:

CS-SC201ab — Exchange of powerplant instruments
CS-SC202b — Use of Avgas UL 91
CS-SC203b — Use of Avgas Hjelmco 91/96 UL and 91/98 UL
CS-SC204a — Installation of external powered engine preheater
CS-SC205a — Installation of fuel low-level sensor (FLLS)
3. Proposed amendments and rationale in detail

CS-SC206a — Exchange of fixed pitch wooden propellers
CS-SC207a — Exchange of hot-air balloon fuel cylinders

Group Flight:
CS-SC251b — Installation of an angle of attack (AoA) indicator system

Group Miscellaneous:
CS-SC401bc — Exchange of basic flight instruments
CS-SC402b — Installation of sailplane equipment
CS-SC403a — Provisions for the installation of lightweight cameras
Standard Change CS-SC002bc

INSTALLATION OF MODE S ELEMENTARY SURVEILLANCE EQUIPMENT

1. Purpose
This SC is for the installation or exchange of a Mode S transponder, including, optionally, an altitude encoder exchange. The individual installation of an altitude encoder is covered by this SC.
This SC does not include the installation of antennas (see CS-SC004, which may be applied concurrently).

Note: This SC does not qualify the TABS equipment installation to meet the transponder or ADS-B requirements defined in Commission Implementing Regulations (EU) Nos 1206/2011\(^\text{13}\) and 1207/2011\(^\text{14}\). Therefore, this TABS installation is not sufficient to permit the pilot to fly the aircraft into transponder mandatory zones (TMZs).

2. Applicability/Eligibility
This SC is applicable to aeroplanes that are not complex motor-powered aircraft, and which have with a maximum cruising speed in ISA conditions below 250 kts, to rotorcraft that are not being complex motor-powered aircraft, and to any ELA2 aircraft.

3. Acceptable methods, techniques, and practices
The following standards contain acceptable data:
— FAA Advisory Circular AC 43-13-2B, Chapter 2, and
— FAA Advisory Circular AC 43.13-1B, Chapter 11.
Additionally, the following conditions apply:
— The transponder equipment and its installation are in compliance with paragraph point CS ACNS.D.ELS.010 of CS-ACNS, and the altitude encoder meets ETSO-C88Aa, or later amendments, or its equivalent.
— The elementary surveillance system provides data according to CS ACNS.D.ELS.015.
— If automatic determination of the on-the-ground status is not available, the on-the-ground status is set to ‘airborne’.
— The reported pressure altitude is obtained from an approved source that is connected to the static pressure system that provides pressure to the instrument used to control the aircraft.
— Any antenna connected to the transponder has a resulting pattern which is vertically polarised, omnidirectional in the horizontal plane and has sufficient vertical beam width to ensure proper system operation during normal aircraft manoeuvres.
— The equipment is qualified for the environmental conditions to be expected during normal operation.
— The instructions from the equipment manufacturer have to be followed.
— A system ground test that verifying all the transmitted data according to ACNS.D.ELS.015 has to be performed.

4. Limitations
Any limitations defined by the equipment manufacturer apply.
In the case of rotorcraft aircraft approved for night-vision imaging systems (NVIS)/night-vision goggles (NVGs), if cockpit panels are to be inserted, the change cannot be considered to be an SC.

An installation according to this SC cannot be claimed to be compliant to with does not satisfy requirements set by CS-ACNS Subpart D Section 4 1090 MHz Extended Squitter (ES) ADS-B Out installations compliant to Section 4 of CS-ACNS or not to with AMC 20-24.

Note: SC-CS006 refers to the installation of ADS-B OUT equipment that is compliant with AMC 20-24.

However, the voluntary transmission of additional ADS-B data (e.g. GPS position and velocity) can be accepted when the position and velocity quality indicators report the lowest quality, the equipment manufacturer has stated compatibility with the directly connected GNSS source, and the transponder is not authorised in accordance with ETSO-C166b or equivalent.

The voluntary transmission of additional ADS-B data (e.g. GPS position and velocity) is also permitted when the position and velocity quality indicators report the quality provided by a Class B TABS certified in accordance with ETSO-C199() or equivalent, or by a GPS source that was certified in accordance with ETSO-C196a, C145c, C145e, C146c, or C146e.

If in case a Class A TABS equipment, which is not certified in accordance with ETSO-C166() or ETSO-C112(), or equivalent, is already installed in the aircraft, the Mode S Transponder system cannot be installed using CS-STAN.

5. Manuals
Amend the AFM with AFMS that containing or referencing the equipment instructions for operation, as required.

Amend the Instructions for Continued Airworthiness (ICAs) to establish maintenance actions/inspections and intervals, as required. In particular, include in the ICAs a check every two 2 years in accordance with the latest version of EASA SIB No. 2011-15.

The ground test shall also include voluntarily transmitted ADS-B data (if any).

6. Release to service
This SC is not suitable for the release to service of the aircraft by the Pilot-owner.
Standard Change CS-SC003bc

INSTALLATION OF AUDIO SELECTOR PANELS AND AMPLIFIERS

1. Purpose
This SC is for the installation or exchange of audio selector panels and amplifiers.
Audio selector amplifiers that feature automatic speech recognition are not eligible for installation by means of this SC.

2. Applicability/Eligibility
This SC is applicable to aeroplanes that are not being complex motor-powered aircraft, to rotorcraft that are not being complex motor-powered aircraft, and to any ELA2 aircraft.

3. Acceptable methods, techniques, and practices
The following standards contain acceptable data:

- FAA Advisory Circular AC 43-13-2B, Chapter 2,
- FAA Advisory Circular AC 43.13-1B, Chapter 11.

Additionally, the following conditions applies:

- the equipment is authorised in accordance with ETSO-C50c or ETSO-C139a, or later amendments, or the equivalent;
- the equipment has at least the audio functionality of the previously installed equipment, and is compatible with the existing installation;
- the equipment is compatible with the connections to the existing communication and navigation systems;
- the equipment is qualified for the environmental conditions to be expected during normal operation; and
- the instructions and tests defined by the equipment manufacturer are followed.

4. Limitations
Any limitations defined by the equipment manufacturer apply.
Any limitations of the existing installation remain valid.

In the case of rotorcraft aircraft approved for NVIS/NVG, if cockpit panels are to be inserted, the change cannot be considered to be an SC.

5. Manuals
Amend the AFM with AFMS that containing or referencing the equipment instructions for operation, as required.

Additionally, add a limitation in the AFMS to forbid the use of the following functions, if available, during take-off and landing:

- bluetooth connections to smartphones,
- telephony functions,
- functions for listening to music.

Amend the Instructions for Continued Airworthiness (ICAs) to establish maintenance actions/inspections and intervals, as required.
6. Release to service

This SC is not suitable for the release to service of the aircraft by the Pilot-owner.
Standard Change CS-SC005a

INSTALLATION OF AN ADS-B OUT SYSTEM COMPLIANT WITH AMC 20-24

1. Purpose
This SC is for the installation of an ADS-B OUT system that is compliant with AMC 20-24\(^\text{15}\).

Note: The aircraft identified in the applicability/eligibility section of this Standard Change do not need to comply with Commission Implementing Regulation (EU) No 1207/2011 or its later amendments. Consequently, they do not need to satisfy the requirements set by CS-ACNS Subpart D Section 4 ‘1090 MHz Extended Squitter ADS-B Out’. The criteria of AMC 20-24 ensure that the aircraft will be seen by air traffic control and ACAS II (TCAS II) equipped aircraft.

2. Applicability/Eligibility
This SC applies to aeroplanes that are not complex motor-powered aircraft, and that have a maximum cruising speed in ISA conditions below 250 kt, to rotorcraft that are not complex motor-powered aircraft, and to any ELA2 aircraft.

3. Acceptable methods, techniques, and practices
The following standards contain acceptable data:
— FAA Advisory Circular AC 43-13-2B, Chapter 2, and
— FAA Advisory Circular AC 43.13-1B, Chapter 11.

Additionally, the following conditions apply:
— The transponder equipment and its installation are compliant with CS-SC002c or later amendments, or are otherwise approved.
— The GNSS receiver is certified in accordance with:
  • ETSO-C129a, or
  • ETSO-C196a and ETSO-C145c or ETSO-C146c, or later revisions, or equivalent.
— TheADS-B transmit unit (transponder) is certified in accordance with ETSO-C166b, or later revisions, or equivalent.
— The GNSS installation is approved, or the GNSS receiver is integrated into the transponder and certified in accordance with ETSO-C196a, C145c, C145e, C146c or C146e.
— There is a direct digital interface between the GNSS receiver and the transponder, or the GNSS receiver is integrated into the transponder and certified in accordance with ETSO-C196a, C145c, C145e, C146c, or C146e.
— The compatibility of the combination of a transponder and a GNSS receiver for compliance with AMC 20-24, including for latency, is explicitly stated by the manufacturer of the transponder.
— The correct transmission of the required parameters, identified in Section 7 of AMC 20-24, is verified during a ground test, which is performed in accordance with the instructions provided by the manufacturer of the transponder. The guidance of Appendix 1 to EASA SIB 2011-15 (latest revision) should be considered.
— The voluntary transmission of any additional parameters is verified to be correct though a ground test that is performed in accordance with the instructions provided by the manufacturer of the transponder.
— Instructions from the equipment manufacturer have to be followed.

4. Limitations
Any limitations defined by the equipment manufacturer apply.
An installation according to this SC cannot be used to claim compliance with CS-ACNS Subpart D Section 4 ‘1090 MHz Extended Squitter ADS-B Out installations’.

5. Manuals
Amend the AFM with AFMS to include a statement of compliance with AMC 20-24.

Amend the Instructions for Continued Airworthiness (ICAs) to establish maintenance actions/inspections and intervals, as required. In particular, include a check every 2 years in accordance with the latest version of EASA SIB No. 2011-15. The ground test shall also include voluntarily transmitted ADS-B data (if any). This check satisfies the requirement for periodical maintenance referred to in AMC 20-24, Section 11.

6. Release to service
This SC is not suitable for the release to service of the aircraft by the Pilot-owner.
Standard Change CS-SC006a

INSTALLATION OR ACTIVATION OF AN ADS-B SYSTEM FOR AIRBORNE AWARENESS

1. Purpose
This SC is for the installation of a new ADS-B system and/or the activation of an existing ADS-B system consisting of a Mode S transponder, a control panel, an altitude encoder and a GNSS receiver. The embodiment of this SC is on a no-hazard/no-credit basis. The ADS-B functionality is intended to be used by general aviation (GA) pilots to gain airborne awareness of ADS-B-equipped aircraft, and it does not comply with CS-ACNS, nor with AMC 20-24.

This SC does not cover the installation of an external antenna (see CS-SC004a, which may be applied concurrently).

Note: The aircraft identified in the applicability/eligibility section of this Standard Change do not need to comply with Commission Implementing Regulation (EU) No 1207/2011 or its later amendments. Consequently, they do not need to satisfy the requirements set by CS-ACNS Subpart D Section 4 ‘1090 MHz Extended Squitter ADS-B Out’ installations. Similarly, the criteria of AMC 20-24 do not need to be met.

2. Applicability/Eligibility
This SC is applicable to aeroplanes that are not complex motor-powered aircraft, and that have a maximum cruising speed in ISA conditions below 250 kt, to rotorcraft that are not complex motor-powered aircraft, and to any ELA2 aircraft.

3. Acceptable methods, techniques, and practices
The following standards contain acceptable data:
— FAA Advisory Circular AC 43-13-2B, Chapter 2, and
— FAA Advisory Circular AC 43.13-1B, Chapter 11.

Additionally, the following conditions apply:
— The ADS-B surveillance functionality provides data according to CS ACNS.D.ADSB.020.
— The transponder equipment and its installation are in compliance with point CS ACNS.D.ELS.010 and the altitude encoder is approved in accordance with ETSO-C88A, or a later revision, or equivalent (credit can be taken from the embodiment of SC002a or later revision).
— If automatic determination of the on-the-ground status is not available, the on-the-ground status is set to ‘airborne’ (credit can be taken from the embodiment of SC002a or later revision).
— The reported pressure altitude is obtained from an approved source connected to the static pressure system that provides pressure to the instrument used to control the aircraft (credit can be taken from the embodiment of SC002a or later revision).
— Any antenna connected to the transponder has a resulting pattern that is vertically polarised, omnidirectional in the horizontal plane, and has sufficient vertical beam width to ensure proper system operation during normal aircraft manoeuvres (credit can be taken from the embodiment of SC002a or later revision).
— The equipment is qualified for the environmental conditions to be expected during normal operation (credit can be taken from the embodiment of SC002a or later revision).
— All instructions and limitations detailed in the equipment installation manuals must be observed.
— Interfaced equipment must be specified within the individual equipment installation manuals.
— A system ground test that verifies all transmitted data, including any optionally transmitted data where provided, according to CS ACNS.D.ADSB.020, must be performed.
3. Proposed amendments and rationale in detail

— The ADS-B transmit unit (transponder) is certified in accordance with ETSO-C166b, or later revisions, or equivalent.

— The GNSS system\(^{16}\) is authorised in accordance with:
  - ETSO-C129a, or
  - ETSO C196a and ETSO C145/C146\(^{17}\), or later revisions, or equivalent.

Note: The GNSS receiver can be integrated into the transponder and authorised in accordance with:
  - ETSO-C196a, or
  - ETSO-C145/C146, or later revisions, or equivalent.

— There is a direct digital interface connection between the GNSS receiver and the transponder (this connection must not be via data converters, data concentrators, interface units, other equipment, etc.);

— Only when the above criteria have been observed can the transponder be configured to report SIL=1 and SDA=1.

4. Limitations

— Any limitations defined by the equipment manufacturer apply.

— In the case of rotorcraft that are approved for NVIS/NVG, if cockpit panels are to be inserted, the change cannot be considered to be an SC.

— This SC does not satisfy the requirements set by CS-ACNS, Subpart D, Section 4, 1090 MHz Extended Squitter ADS-B Out installations, and it is neither compliant with Section 4 of CS-ACNS, nor with AMC 20-24.

— If a traffic awareness beacon system (TABS) equipment is already installed in the aircraft, the Mode S transponder system cannot be installed using CS-STAN.

— Operation of the system is limited to uncontrolled airspace only and is subject to the Member State’s authorisation/conditions as documented in the relevant official aeronautical publication.

5. Manuals

— Amend the AFM with AFMS that contains or references the equipment instructions for operation and any reference to the applicable limitations (refer to paragraph 4 above), as required.

— Amend the Instructions for Continued Airworthiness (ICAs) to establish maintenance actions/inspections and intervals, as required. In particular, include in the ICAs a check every 2 years in accordance with the latest version of EASA SIB No. 2011-15. The ground test shall include all transmitted ADS-B data, including any optionally transmitted data.

6. Release to service

This SC is not suitable for the release to service of the aircraft by the Pilot-owner.

\(^{16}\) The specified GNSS equipment meets the overall accuracy and integrity requirements, including the effects of an uncompensated latency of maximum 1.5 seconds accumulated up to the time of transmission as per EASA AMC 20-24 Table 2 and its associated Note.

\(^{17}\) ETSO C-145/C146() provides additional capabilities compared with ETSO C129A such as processing of SBAS signals when available and ‘fault detection exclusion’ as a basic function. Therefore, ETSO C145/146() usually provides higher integrity values than ETSO C-129A equipment.
Standard Change CS-SC034ab

EXCHANGE OF AN EXISTING BATTERY BY FOR A LITHIUM IRON PHOSPHATE (LiFePO₄) BATTERIES SYSTEM

1. Purpose
This SC is for the exchange of existing batteries by for a LiFePO₄ type batteries system in aircraft.
This SC does not cover or replace the applicable regulations for the handling, storage, transport, and disposal of batteries.

Note: This SC does not cover the installation of a battery at in a new location.

2. Applicability/Eligibility
This SC is applicable to sailplanes, including powered sailplanes.

3. Acceptable methods, techniques, and practices
— Before installation, a statement has to be available to ensure that Acceptable standards for the battery systems, batteries or the battery cells test (performed and stated by the battery manufacturer) are compliant at least with one of the following has to be available:
  • RTCA DO-347, Certification Test Guidance for Small and Medium Sized Rechargeable Lithium Batteries and Battery Systems; or
  • RTCA DO-311A, Minimum Operational Performance Standards for Rechargeable Lithium Batteries and Battery Systems; or
  • UL 1642, Standard for Lithium Batteries, or equivalent; or
  • UL 2054, Standard for Household and Commercial Batteries, or equivalent; or
  • UL 62133 Secondary Cells and Batteries Containing Alkaline or Other Non-Acid Electrolytes – Safety Requirements for Portable Sealed Secondary Cells, and for Batteries Made From Them, for Use in Portable Applications, or equivalent; or
  • UL 1973 Batteries for Use in Stationary, Vehicle Auxiliary Power and Light Electric Rail (LER) Applications, or equivalent; or
  • IEC 62133-2 Secondary cells and batteries containing alkaline or other non-acid electrolytes – Safety requirements for portable sealed secondary cells, and for batteries made from them, for use in portable applications, or equivalent.
— For installation purposes, the FAA Advisory Circular AC 43-13-2B, Chapters 1 and 2, and FAA Advisory Circular AC 43.13-1B, Chapter 11, are contain acceptable data.
— Any impact on the weight and balance of the aircraft needs to be considered.

4. Limitations
— Batteries used for electrical or hybrid propulsion are not covered.
— Starter batteries are not covered.
— The battery system shall have an integrated battery management system provided by the battery manufacturer.
— Each installed battery system shall have a maximum capacity of 160 Wh.
— Any limitation defined by the battery system manufacturer applies.

5. Manuals
Amend the Instructions for Continued Airworthiness (ICAs) to establish maintenance actions/inspections and intervals, as required.
6. **Release to service**

A release to service by the Pilot-owner is acceptable only if the original battery mounting and connectors remain.
Standard Change CS-SC035a

INSTALLATION OF SOLAR CELLS ON SAILPLANES

1. Purpose
This SC is for the installation of solar cells on sailplanes for the purpose of allowing longer operation of the on-board avionics systems.

This SC does not cover solar cells that are used to recharge any batteries or energy storage systems for an electric propulsion system on a powered sailplane.

This SC does not cover the installation of batteries.

2. Applicability/Eligibility
This SC is applicable to ELA1 sailplanes, including powered sailplanes.

3. Acceptable methods, techniques, and practices
The following standards contain acceptable data for installation purposes:
— FAA Advisory Circular AC 43-13-2B, Chapters 1 and 2, and
— FAA Advisory Circular AC 43.13-1B, Chapter 11.

Additionally, the following conditions apply:
— The solar cells shall be located either in the area of the upper side of the fuselage between the tangential bolts connecting the wings to the fuselage, and/or on the doors of a retractable engine, if applicable. Typically, the solar cells are bonded to the surface with self-adhesive tape as described/specified by the solar cell manufacturer.
— Any holes required to route cables from the solar cells into the inner parts of the fuselage must not be larger than 5 mm in diameter, and special attention is required to prevent any chafing or short-cuts in these feedthroughs. If several holes are required for these feedthroughs, then these shall not be closer than 30 mm from each other, and the number of holes must be minimised.
— Special care is required to not damage bulkheads or stringers on the inside of the fuselage structure when drilling these holes.
— Seal any hole in the skin and in the solar panel to prevent any moisture penetration beneath the solar panels.
— The distance between the new holes and the cut-outs or other edges should comply with the aircraft manufacturer’s guidance. In the absence of such guidance, a minimum of 100 mm should be considered.
— The electrical connection to the storage battery(ies) shall be installed according to the instructions of the solar cell charging system manufacturer, and shall:
  • provide circuit protection (e.g. circuit breakers) against system overloads, and against smoke and fire hazards that result from intentional or unintentional system shorts, faults, etc.;
• Provide a clearly labelled ‘on/off switch’ for deactivating all solar cells that is easily accessible by the pilot-in-command when in flight. As an alternative, a clearly labelled switch-rated circuit breaker may be used to also provide the circuit protection.

*Note:* The use of circuit breakers as switches is not acceptable, as it can degrade their protection function, except for switch-rated circuit breakers, provided that they are shown to be appropriately rated for the number of switch cycles expected during the service life of the system or of the circuit breakers.

— After installation, perform a test to ensure that the flight control systems can move freely.

— Before the first operation in flight, a functional test of the system needs to be conducted on the ground with special attention paid to any possible overcharging or overheating of the system.

— Any impact on the weight and balance of the aircraft needs to be considered.

— Instructions and tests defined by the equipment manufacturer shall be followed.

### 4. Limitations

— If more than one battery will be charged, then all these batteries must have the same voltage and be of the same type and voltage (e.g. only lead-acid batteries running on 12 V).

— Any limitations defined by the solar cell and charging system manufacturer apply.

— Any limitations defined by the aircraft manufacturer apply (e.g. a limitation to install such solar cells onto a certain area on the surface of the sailplane).

— The installation of solar cells on structural parts such as the fuselage (i.e. not on the doors) is subject to the aircraft manufacturer not objecting to this installation.

— Ground charging by means of solar cells is not allowed.

— Solar cells must always be connected to the storage battery; direct charging of flight instruments and ATC equipment is not allowed.

— The maximum power of the solar cells installed by means of this SC cannot exceed 40 W.

### 5. Manuals

Amend the AFM with AFMS that contains or references the equipment instructions for operation, as required.

Amend the Instructions for Continuing Airworthiness (ICAs) to establish the required actions regarding the maintenance/cleaning/caring actions for the solar cells and charging system, as required.

### 6. Release to service

This SC is not suitable for the release to service of the aircraft by the Pilot-owner.
Standard Change CS-SC036a

INSTALLATION OF VISUAL AWARENESS LIGHTS

1. Purpose
This SC is for the installation of visual awareness lights that are not certified as anticollision lights and are not required by operational rules. These lights are typically high-intensity LEDs.

Due to their specialised purpose of helping pilots to avoid mid-air collisions, such light systems often have a limited field of coverage in the forward sector of the aircraft and/or they do not comply with the requirements as specified in the airworthiness requirements for aeroplanes (e.g. in CS-23).

Note: For the installation of anti-collision lights, refer to CS-SC032.

2. Applicability/Eligibility
This SC is applicable to ELA2 aircraft.

3. Acceptable methods, techniques, and practices
The following standards contain acceptable data for installation purposes:
— FAA Advisory Circular AC 43-13-2B, Chapters 1 and 2 are acceptable, and
— FAA Advisory Circular AC 43.13-1B, Chapter 11.

Additionally, the following conditions apply:
— Any impact on the weight and balance of the aircraft needs to be considered.
— For sailplanes, the visual awareness light systems shall be installed in one or more of the following locations:
  • in the area of the upper/lower side of the fuselage between the tangential bolts connecting the wings to the fuselage;
  • on the doors of a retractable engine;
  • on the doors of the landing gear;
  • on the nose of the aircraft;
  • on the outer side of the wing tips;
  • on the empennage;
  • on top of the instrument panel;
  • in the inside of the forward part of the canopy.
— For other aircraft, consider the conventional airframe locations for these lights.
— Typical installations are streamlined shapes mounted on the upper/lower side of the fuselage, the aircraft nose or wing tips, and devices installed on the inside of the canopy facing forward with provisions to not blind the pilot with the emitted light.
— For aircraft that only have storage batteries, the visual awareness light systems must be suitable for the voltage, power and type of these batteries.

— For aircraft with conventional power systems, an electrical load analysis has to be considered.

— Any holes required to mount the visual awareness light and the related route cables into the inner parts of the fuselage must not be larger than 5 mm in diameter. Special attention is required to prevent any chafing or short-cuts in these feedthroughs.

— If several holes are required for these feedthroughs, then these shall not be closer than 30 mm from each other, and the number of holes must be minimised.

— Special care is required to not damage bulkheads or stringers on the inside of the fuselage structure when drilling these holes.

— Follow the instructions of the visual awareness light manufacturer. Special care is required to prevent any possibility that the operating visual awareness light might blind the pilot or that the visual awareness light might hinder forward vision for the pilot or other aircrew on board.

The design of the equipment installation must take into account crashworthiness, the arrangement and visibility of the installation, and any interference with other equipment.

Additionally, if the system is mounted in the inner side of the canopy or on the instrument panel, the design of the equipment installation must take into account the canopy jettison and the emergency exit.

— The electrical connection to the storage battery(ies) shall be installed according to the instructions of the visual awareness light system manufacturer, and shall:
  - provide circuit protection (e.g. circuit breakers) against system overloads, smoke and fire hazards that result from intentional or unintentional system shorts, faults, etc.;
  - provide a clearly labelled ‘on/off switch’ for deactivating all visual awareness lights that is easily accessible by the pilot-in-command in flight. As an alternative, a clearly labelled switch-rated circuit breaker may be used to also provide circuit protection.

  Note: The use of circuit breakers as switches is not acceptable, as it can degrade their protection function, except for a switch-rated circuit breaker, provided that it is shown to be appropriately rated for the number of switch cycles expected during the service life of the system or of the circuit breaker.

— Before the first operation in flight, a functional test of the system has to be conducted on the ground with special attention to the possible blinding of the pilot or the overheating of the system.

— Instructions and tests defined by the equipment manufacturer shall be followed.

— For aircraft that are not limited to day VFR conditions, a placard shall be installed to limit the use of visual awareness lights to day VFR conditions only.

4. Limitations

— Visual awareness lights should be operated in day VFR conditions only.

— Any limitations defined by the visual awareness light system manufacturer apply.

— Any limitations defined by the aircraft manufacturer apply (e.g. a limitation to only install such visual awareness light onto a certain area on the surface of the aircraft).
— This SC does not cover visual awareness light systems that require any modifications to parts of the wings (except wing tips) or to the empennage of the aircraft.

— The maximum number of visual awareness lights installed on each wing and the empennage is one on each.

5. Manuals

The AFMS shall, at least, contain:

— a description of the system, its operating modes and functionality;
— limitations, warnings and placards, as required;
— the normal and emergency operating procedures.

Amend the Instructions for Continuing Airworthiness (ICAs) to establish the required actions regarding the maintenance/cleaning/caring actions for the visual awareness light system, as required.

6. Release to service

This SC is not suitable for the release to service of the aircraft by the Pilot-owner.
Standard Change CS-SC037a

EXCHANGE OF A MAIN AIRCRAFT BATTERY

1. Purpose
This SC is for the exchange of a main aircraft battery (e.g. starter battery, batteries for sailplanes) for another type that meets the same minimum standards.
This SC does not cover the installation of lithium batteries.
This SC does not cover the installation of a battery in a new location.

2. Applicability/Eligibility
This SC is applicable to aeroplanes that are not complex motor-powered aircraft, to rotorcraft that are not complex motor-powered aircraft, and to any ELA2 aircraft.

3. Acceptable methods, techniques, and practices
The following standard contains acceptable data for installation purposes:
— FAA Advisory Circular AC 43-13-2B, Chapters 1, 2 and 10.
Additionally, the following conditions apply:
— Acceptable standard for the battery or the test of the battery cells (performed and stated by the battery manufacturer) is:
  • ETSO-C173A or later amendments, or equivalent.
— Any impact on the weight and balance of the aircraft shall be considered.
— The new battery shall:
  • feature a maximum power that is greater than or equal to the power of the replaced battery;
  • have a capacity that is greater than or equal to the capacity of the replaced battery.

4. Limitations
— Any limitations defined by the battery manufacturer apply.
— The regulations for the handling, storage, transport, and disposal of batteries apply.
— Batteries used for electrical or hybrid propulsion are not covered.
— Backup batteries that support essential systems such as avionics, or that are used for IFR, are not covered by this SC.

5. Manuals
Amend the Instructions for Continues Airworthiness (ICAs) to establish maintenance actions/inspections and intervals, as required.

6. Release to service
This SC is not suitable for the release to service of the aircraft by the Pilot-owner.
Standard Change CS-SC038a

INSTALLATION OF DC TO DC CONVERTERS

1. Purpose
This SC is for installations of direct current (DC) to DC converters to support avionics installations and equipment that require a power supply with a controlled voltage.

2. Applicability/Eligibility
This SC is applicable to aeroplanes that are not complex motor-powered aircraft, to rotorcraft that are not complex motor-powered aircraft, and to any ELA2 aircraft.

3. Acceptable methods, techniques, and practices
The following standards contain acceptable data:
— FAA Advisory Circular AC 43-13-2B, Chapters 1 and 2, and
— FAA Advisory Circular AC 43.13-1B, Chapter 11.

Additionally, the following conditions apply:
— The DC to DC converters are authorised in accordance with ETSO-C71 or later amendments, or the equivalent.
— The installation of the DC to DC converters shall be protected by circuit protection (e.g. circuit breakers) against system overloads, smoke and fire hazards that result from intentional or unintentional systems shorts, faults, etc.
— The design of the equipment installation must take into account crashworthiness, the arrangement of the installation and any interference with other equipment.
— The design of the equipment installation must take into account the structural integrity of the instrument panel or any other attachment point. Special consideration is necessary for equipment that is installed at a location behind the occupant(s).
— The equipment is suitable for the environmental conditions to be expected during normal operation.
— Installation instructions and tests defined by the equipment manufacturer have to be followed.
— If multiple bus-bars are available, the DC to DC converter should be connected to the bus-bar that supports the criticality that is appropriate to the equipment that the converter supplies.
— If there are systems or equipment that are supplied by an essential power supply, i.e. systems or equipment that are necessary for continued safe flight and landing, an electrical load analysis or electrical measurements shall be undertaken. This analysis or measurement shall take into account the maximum loading that may be utilised from the power supply system (PSS) for the portable electronic device (PED) to substantiate that the aeroplane’s electrical power generating system has sufficient capacity to safely provide the maximum amount of power required by the PSS for the PED. This assessment shall be recorded in EASA Form 123.
— Perform an electromagnetic interference (EMI) test to assess any interference from the converter with other systems.

4. Limitations
Any limitations defined by the equipment manufacturer apply.
5. Manuals
Amend the Instructions for Continues Airworthiness (ICAs) to establish maintenance actions/inspections and intervals, as required.

6. Release to service
This SC is not suitable for the release to service of the aircraft by the Pilot-owner.
Standard Change CS-SC051bc

INSTALLATION OF ‘FLARM’ EQUIPMENT

Note: Originally Flight Alarm (FLARM®) equipment was developed for sailplanes, but nowadays such devices are more and more installed in other light aeroplanes aircraft as well. While FLARM® devices are considered to be Standard Parts in the case of sailplanes, and 21.A.307(c) may allow their installation without Form 1.

1. Purpose

This SC is for the installation or exchange of FLARM® Anti-Collision Awareness traffic awareness and collision avoidance Systems. These systems are based on the specifications as defined by FLARM Technology GmbH Ltd.

Note: FLARM equipment is not compatible with is not equivalent to Transponder Mode A/C/S, ADS-B, Class A TABS or TCAS/ACAS equipment.

The installation of additional batteries is not covered by this SC.

This SC does not cover the installation of external antennas (see CS-SC004, which may be applied concurrently).

2. Applicability/Eligibility

ELA2 aircraft.

3. Acceptable methods, techniques, and practices

The following standards contain acceptable data:

— FAA Advisory Circular AC 43-13-2B, Chapters 1 and 2, and
— FAA Advisory Circular AC 43.13-1B, Chapter 11.

Additionally, the following conditions apply:

— The design of the equipment installation must take into account crashworthiness, the arrangement of the installation and its visibility, interference with other equipment, the canopy jettison and the emergency exit.

— The design of the equipment installation must take into account the structural integrity of the instrument panel or any other attachment point. Special consideration is necessary for equipment installed at a location behind the occupant(s).

— Data bus/data connectivity between the FLARM device and other equipment which is:
  - ETSO-authorised (or the equivalent); or
  - required by TCDS, AFM or POH;
  - required by other applicable requirements such as those for operations and airspace; or
  - mandated by the respective Minimum Equipment List (MEL), if this exists, is not allowed unless the FLARM device is explicitly listed by its manufacturer as compatible equipment to which the other equipment can be connected to.

— The equipment is suitable for the environmental conditions to be expected during normal operation.

— Instructions and tests defined by the equipment manufacturer have to be followed.
— Fly the aircraft to assess the installation for satisfactory antenna coverage and identify eventual any possible limitations, by analysing data from the built-in flight recorder with the 'FLARM Range Analyzer' tool of FLARM Technology GmbH Ltd (available at www.flarm.org).

Note: The above-mentioned flight is considered to be part of the SC installation activity, and it can be conducted without an individual Permit to Fly or any other certificate of release to service for the SC installation, as long as there is no other maintenance activity ongoing on the aircraft (i.e. other maintenance, which has not yet been released to service). The flight should be conducted by a pilot who understands the aircraft configuration (i.e. for an FLARM installation that has not yet been released to service). EASA Form 123 and the certificate of release to service for the installation of the SC should be issued after assessing satisfactorily the result provided by the FLARM range analyzer tool has been assessed and found to be satisfactory.

4. Limitations
— The FLARM® based system cannot be used to substitute for any Anti-Collision Device mandated by the EASA OPS rules for the intended operation intended.
— The system is not to be used in conjunction with night vision systems or in night or IMC conditions. In the case of aircraft that are approved for NVIS/NVG, if cockpit panels are to be inserted, the change cannot be considered to be an SC.
— Any limitations defined by the manufacturer of the FLARM® device are applicable. These must include periodical firmware and database updates.

5. Manuals
The AFMS shall, at least, contain:
— the a description of the system description, its operating modes and its functionality;
— limitations, warnings and placards, at least, for the following:
  • ‘For situational awareness only’,
  • ‘Use in day VFR day only’;
— the normal and emergency operating procedures; and
— instructions for carrying out software and database updates.

Amend the Instructions for Continues Airworthiness (ICAs) to establish maintenance actions/inspections and intervals, as required.

6. Release to service
This SC is not suitable for the release to service of the aircraft by the Pilot-owner.
Standard Change CS-SC052bc

INSTALLATION OF GNSS EQUIPMENT

1. Purpose
This SC is for the installation or exchange of a GNSS equipment to enhance situational awareness. This could also include moving map GNSS-based functions.

This SC does not include the installation of external antennas (see CS-SC004, which may be applied concurrently).

For integrated systems that also providing voice communications functionality and/or a VOR navigation capability, CS-SC052 may be applied concurrently with CS-SC001 and/or CS-SC056.

This SC does also not cover the connection of the GNSS equipment to any kind of AFCS, nor to an ADS-B OUT system.

2. Applicability/Eligibility
This SC is applicable to non-pressurised aircraft with MTOMs of less than 2 721 kg (6 000 pounds) other than rotorcraft approved for NVIS.

3. Acceptable methods, techniques, and practices
The following standards contain acceptable data:

— FAA Advisory Circular AC 20-138D, including Change 1 and Change 2, Appendix 6, with the exception of paragraphs A6-4.c and A6-4.f.

— FAA Advisory Circular AC 43-13-2B, Chapter 1 and 2, and

— FAA Advisory Circular AC 43.13-1B, Chapter 11.

Additionally, the following conditions apply:

— The design of the equipment installation must take into account crashworthiness, the arrangement and visibility of the installation, and it should not interfere with any other equipment, the canopy jettison (if applicable), and the emergency exit;

— Data connectivity with the installed equipment and other equipment which is:
  • required by the TCDS, AFM or POH,
  • required by other applicable requirements such as those for operations and airspace, or
  • mandated by the respective MEL, if this exists,

is not allowed unless the equipment being installed is explicitly listed by its manufacturer as compatible equipment to which the other equipment can be connected to;

— The equipment is suitable for the environmental conditions to be expected during normal operation;

— The equipment must be installed and tested in accordance with the equipment manufacturer’s instructions.

4. Limitations
— The system is to be used for situational awareness under VFR only.
The equipment installation cannot be used to extend the operational capability of the specific aircraft (e.g. from VFR to IFR);

— All relevant integrated databases (e.g. for charts) must be current;

— In the case of aircraft that are approved for NVIS/NVG, if cockpit panels are to be inserted, the change cannot be considered to be an SC.

— Any limitations defined by the equipment manufacturer apply.

5. **Manuals**

The AFMS shall, at least, contain:

— the description **of the system description**, its operating modes and its functionality;

— a limitations section stating the following:

  - ‘This equipment is to be used for situational awareness only’, and

— the normal and emergency operating procedures;

 Amend the maintenance manual with instructions for carrying out software and database updates.

 Amend the Instructions for Continues Airworthiness (ICAs) to establish maintenance actions/inspections and intervals, as required.

6. **Release to service**

This SC is not suitable for the release to service of the aircraft by the Pilot-owner.
Standard Change CS-SC058ab

INSTALLATION OF TRAFFIC AWARENESS BEACON SYSTEM (TABS) EQUIPMENT

1. Purpose
This SC is for the installation of traffic awareness beacon systems (TABS).

TABS equipment is intended for use as voluntary equipage optional equipment on aircraft that are not required to carry a transponder or automatic dependent surveillance - broadcast (ADS-B) equipment.

The installation of a TABS will enable an aircraft to be visible to air navigation service providers and other aircraft equipped with:
— a traffic advisory system (TAS);
— a traffic alert and collision avoidance system I (TCAS I);
— a traffic alert and collision avoidance system II (TCAS II); or
— ADS-B IN capability.

This SC does not qualify the TABS equipment installation, in which the Class A TABS is not authorised according to ETSO-C112(), as compliant with the transponder or ADS-B requirements defined in European Commission Implementing Regulations (EU) Nos 1206/2011 and (EU) No 1207/2011. Therefore, this TABS installation, in which the Class A TABS is not authorised according to ETSO-C112(), is not sufficient to permit the pilot to fly the aircraft into transponder mandatory zones (TMZs). Additional requirements may apply, refer to CS-SC002b or a later amendment.

The installation of a TABS will enable an aircraft to be visible to air navigation service providers and other aircraft equipped with:
— traffic advisory system (TAS); or
— traffic alert and collision avoidance system I (TCAS I); or
— traffic alert and collision avoidance system II (TCAS II); or
— ADS-B IN capability.

2. Applicability/Eligibility
This SC is applicable to aeroplanes that are not being complex motor-powered aircraft, to rotorcraft that are not being complex motor-powered aircraft, and to any ELA2 aircraft.

3. Acceptable methods, techniques, and practices
The following standards contain acceptable data:

Additionally, the following conditions apply:
— The equipment is authorised according to ETSO-C199.
— The design of the equipment installation must take into account crashworthiness, the arrangement and visibility of the installation, any interference with other equipment, the canopy jettison and the emergency exit.

ETSO-C199 will be published as part of CS-ETSO issue 13.
3. Proposed amendments and rationale in detail

— The design of the equipment installation must take into account the structural integrity of the instrument panel or any other attachment point. Special consideration is necessary for equipment installed at a location behind the occupant(s).

— Data connectivity with between the TABS equipment and other equipment which is:
  
  • required by TCDS, AFM or POH; or
  • required by other applicable requirements such as those for operations and airspace; or
  • mandated by the respective minimum equipment list (MEL), if this exists, is not allowed unless the TABS is explicitly listed by its manufacturer as compatible equipment to which the other equipment can be connected to;

— The equipment is suitable for the environmental conditions to be expected during normal operation;

— Instructions and tests defined by the equipment manufacturer have to be followed.

4. Limitations

— Any limitations defined by the manufacturer of the TABS equipment apply.

— ADS-B IN information, if provided, is for situational awareness only.

— If in case a Mode A/C/S Transponder system is already installed in the aircraft, the a Class A TABS equipment cannot be installed using CS-STAN.

5. Manuals

The AFMS shall, at least, contain:

— the a description of the system description, its operating modes and its functionality;

— the normal and emergency operating procedures;

— If the TABS provides ADS-B IN information, the AFMS must include a statement that the ADS-B IN data is to be used for situational awareness only.

Amend the Instructions for Continues Airworthiness (ICAs) to establish maintenance actions/inspections and intervals, as required, including instructions for carrying out in case of software and database updates.

6. Release to service

This SC is not suitable for the release to service of the aircraft by the Pilot-owner.
Standard Change CS-SC084a

REPAINTING OF COMPOSITE AIRCRAFT STRUCTURES

1. Purpose
This SC is for the repainting of the outer surfaces of composite aircraft with alternative varnishes of the acrylic or polyurethane (PUR) paint types.

2. Applicability/Eligibility
This SC applies to ELA2 aircraft with composite structures.

3. Acceptable methods, techniques, and practices
   — Remove the old gelcoat or paint (e.g. by sanding down) and ensure that the resulting surface is adequate for the repainting (i.e. free of cracks, pinholes or voids, free of any grease or silicone or dust).
   — Inspect the structure in order to ensure that:
     ● the structure has not been damaged during the removal of paint;
     ● all the repairs that are found have been made against applicable repair instructions.
   — The paint manufacturer’s instructions and safety information shall be observed.
   — After each renewal of the coat of paint, a weight and balance check of the aircraft must be completed, in particular it shall be assured that the weight and the residual moments of control surfaces are within acceptable limits.
   — Respect/replicate any mandatory placards or markings.

4. Limitations
   — Any limitations defined by the paint manufacturer apply.
   — Any limitations defined by the aircraft manufacturer apply (e.g. a limitation to a white surface colour and/or limits to the mass balancing (the weight and moment) of any control surface).

5. Manuals
Amend the Instructions for Continuing Airworthiness (ICAs) to establish the required actions regarding the maintenance/cleaning/caring actions for the new outer surface, as required, referring to the paint manufacturers’ maintenance and repair instructions.

6. Release to service
This SC is not suitable for the release to service of the aircraft by the Pilot-owner.
Standard Change CS-SC085a
EXCHANGE OF AN AIRCRAFT LIVERY PAINT AND DECORATIVE STICKER SCHEME

1. Purpose

This SC is for a full or partial exchange of the design of the external livery of an aircraft.

2. Applicability/Eligibility

This SC applies to aeroplanes that are not complex motor-powered aircraft, to rotorcraft that are not complex motor-powered aircraft, and to any ELA2 aircraft.

3. Acceptable methods, techniques, and practices

(a) Paint/sticker materials to be used: by default, only materials (e.g. primer, filler, top coat, gelcoat, decorative adhesive sticker, etc.) that have been approved to be used on a given aircraft through the existing applicable maintenance data (e.g. the aircraft maintenance manual (AMM), supplemental maintenance manual (SMM), or any other Instructions for Continued Airworthiness (ICAs) applicable to the aircraft) shall be used.

If some or all of the materials listed in the existing ICAs are either no longer available (obsolete) or not compliant with the applicable environmental protection requirements, then the following two options apply:

— the use of alternate materials shall be approved in accordance with Part 21, or
— materials may be used if they have been declared by the materials’ manufacturer(s) to be equivalent to the materials listed in the existing ICAs.

(b) Application processes for paint/sticker materials: any application processes/techniques that were approved by the TC/STC holder through the applicable maintenance data (e.g. the AMM, the SMM, or the equivalent ICAs) shall be followed.

Otherwise, the application processes/techniques that were documented and published by the manufacturer of the materials shall be followed.

In any case, the aircraft pre-painting preparation tasks and the final checks (bounding, balance, etc.), if any, that were defined by the TC/STCH shall be followed.

(c) Design of the external livery: when defining the design of the external livery, the following must be considered:

(1) Markings: each emergency exit and external door (if any) in the passenger compartment must be externally marked and readily identifiable from outside the aeroplane by:

— a conspicuous visual identification scheme; and
— a permanent decal or placard on or adjacent to the emergency exit that shows the means of opening the emergency exit, including any special instructions, if applicable.

Each placard and operating control for each emergency exit must be red in colour.

(2) Fuel filler openings must be marked at or near the filler cover with:

— for reciprocating engine-powered aircraft:
  • the word ‘Avgas’ or ‘MOGAS’, as applicable; and
  • the minimum fuel grade;
— for turbine engine-powered aircraft:
  • the word ‘Jet Fuel’; and
3. Proposed amendments and rationale in detail

- the permissible fuel designations, or references to the aircraft flight manual (AFM) for permissible fuel designations;
  - for pressure fuelling systems, the maximum permissible fuelling supply pressure and the maximum permissible defuelling pressure.

(3) Oil filler openings must be marked at or near the filler cover with:
  - the word ‘Oil’; and
  - the permissible oil designation, or references to the AFM for permissible oil designations.

(4) Coolant filler openings must be marked at or near the filler cover with the word ‘Coolant’.

(5) The system voltage of each direct current installation (if any) must be clearly marked adjacent to its external power connection.

(6) Every external marking/placard (including the aircraft registration marks) must have a colour contrast that is readily distinguishable from the surrounding surface.

(7) After the painting or application of decorative stickers, every placard originally installed as per the aircraft ICAs shall be reinstalled and verified for proper readability.

(d) Slip-resistant surfaces:

(1) If any areas of the aircraft are already covered with slip-resistant material (e.g. the upper surface of the wing root), those areas must either remain untouched, or identical areas of the slip-resistant material approved by the TC or STC holder can be reinstalled following the embodiment of the new paint scheme.

(2) Using this SC, the areas that are covered with slip-resistant material shall not be enlarged, and no such areas shall be added to an existing design. Any enlargement of, or addition to, the areas covered with slip-resistant material shall be approved in accordance with Part 21.

(e) Weight and balance:

(1) Emphasis is directed to the effect of too many extra coats of paint on the general weight and balance of an aircraft, and more particularly in regard to balanced control surfaces. Adding additional coats of paint in excess of what the TC or STC holder originally applied in accordance with existing applicable maintenance data must be avoided. Where available, the TC or STC holder’s instructions relative to the finishing and balance of control surfaces must be consulted and followed.

(2) If the design change involves the painting of the complete aircraft (or extensive use of decorative stickers), then after the completion of the painting, the aircraft must be weighed in accordance with the TC holder’s applicable maintenance data. The aircraft weight and balance report shall be updated accordingly.

4. Limitations

Any limitations defined by the TC or STC holder apply.

If materials that are not listed in the existing ICAs have been used, any limitations defined by the manufacturers of the materials apply.
5. Manuals

Amend the ICAs to include a clear and complete description of the external livery paint scheme. It is recommended that this description should take the form of a drawing that includes:

— the overall design, including the dimensions and details of any painted markings;
— the paint/decorative sticker reference(s) and colour(s);
— the type, serial number and registration of the aircraft that the drawing belongs to.

Notes:

— If materials have been used that are not listed in the existing ICAs, proof from the manufacturer of the materials that the materials used are considered to be equivalent to the materials listed in the existing ICAs must be recorded as part of the aircraft records.
— If application processes/techniques have been used that are not documented in the applicable maintenance data (the AMM, the SMM, or the equivalent ICAs), the documented application processes/techniques of the manufacturer of the materials must be recorded as part of the aircraft records.

6. Release to service

This SC is not suitable for the release to service of the aircraft by the Pilot-owner.
Standard Change CS-SC086a

EXCHANGE OF A BALLOON ‘BOTTOM-END’

1. Purpose
This SC is for the replacement of a complete bottom-end with a different one that is part of the type certificate of another approved balloon.

A complete bottom-end comprises the basket, the burner frame, the burner, the fuel cylinders and the fuel hoses.

Note: In a balloon, the envelope identifies the aircraft registration, the type certificate and the serial number. Changing the bottom-end is considered to be a modification to the aircraft type design, i.e. it results in a modified balloon. The certificate of airworthiness, the aircraft flight manual, the aircraft logbook, etc., belong to the modified balloon (i.e. they ‘remain’ with the envelope).

2. Applicability/Eligibility
This SC is applicable to hot-air balloons, as defined in ELA1, which are used in non-commercial operations.

3. Acceptable methods, techniques, and practices
The following considerations apply:

— The maximum take-off weight of the modified balloon shall not be greater than the original one.

— The minimum landing mass of the modified balloon must be greater than or equal to the approved minimum landing mass of the original balloon. A good estimate for the minimum landing mass is 150 kg / 1000 m³.

— The performance of the burner must be adequate for the size of the envelope.

— The number of attachment points for the basket wires in the original configuration must be the same as in the new configuration after the exchange.

— The number of attachment points for the flying wires in the original configuration must be the same as in the new configuration after the exchange.

— The burner frame geometry regarding the position of attachment points must be congruent (same dimension in x and y direction, in the same plane).

— If the bottom-end from manufacturer A is combined with an envelope from manufacturer B, then:
  • check that the geometry of the attachment points of the bottom-end from manufacturer A is identical to the geometry of the attachment points of the burner frame from manufacturer B, as referenced in the flight manual of manufacturer B for the selected envelope;
  • a tolerance of 25 mm between two attachment points is acceptable.

4. Limitations
— All parts must be included in an EASA-approved type design.

— Any limitations defined by the manufacturers of the bottom-end and the envelope apply.

— This SC is limited to configurations that do not require rotation valves.
5. Manuals

The flight manual of the modified balloon must be supplemented for the bottom-end, and it should contain, at least, the following:

— a description of the system, its operating modes and its functionality;
— the limitations and warnings;
— the emergency and normal operating procedures;
— Instructions for Continued Airworthiness (ICAs).

6. Release to service

This SC may be released by the Pilot-owner subject to compliance with AMC M.A.801.
Standard Change CS-SC105a

INSTALLATION OF MOUNTING SYSTEMS TO HOLD EQUIPMENT

1. Purpose
This SC is for the installation of ‘mounting systems’ intended to hold pilot’s equipment inside the cockpit or the cabin. This SC only addresses the mechanical installation.

Note: This SC does not apply to hand-held carry-on cameras, nor to devices worn by the pilot, e.g. helmet-mounted cameras.

2. Applicability/Eligibility
This SC is applicable to ELA2 aeroplanes.

3. Acceptable methods, techniques, and practices
For the purpose of this SC, the following definitions apply:

— ‘installer’ means the person who releases the aircraft to service in accordance with AMC M.A.801 (carrying out this SC);
— ‘mounting system’ means the structural provisions such as suction mounts, brackets, clamps or any attachments which are fastened or bonded and installed in the aircraft through this SC;
— ‘equipment’ means the equipment used and installed by the pilot on the mounting system defined above in accordance with the data established and released by the installer;
— ‘unit’ means the ‘equipment’ plus the ‘mounting system’.

Installation conditions:

— If the unit is fitted in or near the cockpit, it must not interfere with any cockpit controls, nor obstruct the pilot’s view of the instruments, or the pilot’s external view, and it must not cause a distraction.
— The mounting system must be installed on one of the fixed surfaces of the aircraft, i.e. not on any control system components that are subject to motion. There must be no interference with the flight controls.
— Where brackets, clamps and/or attachments are used, care must be taken to ensure that they do not damage the aircraft structure that carries flight loads.
— If existing airframe structural fastener locations are picked up, then additional installed brackets of the mounting system should be of the same material as the underlying structure, and the new attachment bolts will need to be of sufficient length to maintain safety and to maintain suitable thread engagement and protrusion. However, it should be ascertained that no external or internal parts or systems, including the flight controls, could be fouled or obstructed by employing longer fasteners. Note that no part of the mounting system should be introduced that acts as a packer between any major load paths, e.g. where a bracket would act as a washer under the bolt head or nut; the size of the bolt should be taken into consideration, and all disturbed fasteners must be inspected prior to the release to service of the aircraft by the installer.
— If suction mounts are used inside the cockpit or cabin, a suitable secondary retaining lanyard or strap should be attached to the unit to prevent any damage or a control jam if the primary suction mount becomes detached.
The equipment mounted on the holding structural provisions in occupied areas should be installed so as to meet the requisite crash load requirements so that they will not detach, or become loose and cause injury to the occupants during operation or in the event of an emergency landing.

For suction mountings, the primary suction mounting and secondary lanyard/strap should be assessed so that each is independently capable of carrying the load.

Push/Pull test requirement: the equipment should be weighed prior to installation and checked to ensure that the total unit weight does not exceed 300 g. Installers are advised to record the weight of the mounting system in a visible area.

In order to check the security of the mounting system in flight, ground and emergency landing cases, a spring balance or another suitable method should be used to independently apply loads to the mounted unit of at least:

- 9 times the unit weight forwards,
- 4.5 times the unit weight up,
- 6 times the unit weight down,
- 3 times the unit weight port,
- 3 times the unit weight starboard.

Loading should be applied for at least 3 seconds with no failures, damage or permanent distress. Higher load factors should be considered to be appropriate for aerobatic use and should include a 9 times unit weight downwards case.

When a suction mount is used, pull testing should be used to confirm the integrity of the secondary retention to at least 10 times the unit weight. Periodic rechecking of the primary mount integrity is advised.

Proprietary self-adhesive mounts can be used in accordance with the manufacturer’s instructions provided that they are capable of passing the pull tests. Installation of a secondary independent lanyard/strap retention feature may also be considered to be prudent when using these types of mounts.

Additionally, the following considerations apply:

As part of applying this SC, the installer shall:

- define and record the locations where the mounting systems can be installed on the individual aircraft; and
- list the acceptable and tested mounting systems, their weights, and the part numbers or other means by which they are identifiable.

In the particular case of balloons and rotorcraft, pull tests shall:

- be performed on all locations where a camera can be installed; and
- be performed in all possible landing directions, including vertically downwards (−z).

No items with sharp edges shall be installed in close proximity to the head of any occupant.

4. Limitations

Any limitations defined by the equipment manufacturer apply.

The maximum mass of the unit shall not exceed 300 g.
5. Manuals

Amend the AFM to reference the instructions for operation and the weight of the mounting system, as required.

Amend the Instructions for Continuing Airworthiness (ICAs) to establish maintenance actions/inspections and intervals, as required. There is a concern that self-adhesive mounts may be subject to environmental deterioration, especially for installations used over a long period of time. Therefore, periodic inspections on the whole mounting system shall be mandated and, if there are signs of deterioration, a pull test of the strength and integrity of the unit shall be performed. Parts that show signs of deterioration must be rectified or replaced.

6. Release to service

This SC is not suitable for the release to service of the aircraft by the Pilot-owner.
Standard Change CS-SC106a

INSTALLATION OF FLIGHT TIME RECORDERS

Note: Flight time recorders record the flight time, engine time, take-offs and landings, or a combination of them, for the purpose of creating logbook entries and for accounting. Flight time recorders that are subject to this SC are not required to be in compliance with ETSO-2C197 or equivalent standards.

Subject to the conditions of point 21.A.307(c), they may be installed without EASA Form 1.

1. Purpose
This SC is for the installation or exchange of flight time recorders without affecting any aircraft systems or installing any new data acquisition points.

The installation of additional batteries is not covered by this SC.

This SC does not cover the installation of external antennas (see CS-SC004, which may be applied concurrently).

2. Applicability/Eligibility
This SC is applicable to ELA2 aircraft.

3. Acceptable methods, techniques, and practices
The following standards contain acceptable data:

— FAA Advisory Circular AC 43-13-2B, Chapters 1, 2 and 11.

Additionally, the following conditions apply:

— The design of the equipment installation must take into account crashworthiness, the arrangement and visibility of the installation, any interference with other equipment, the jettison of the canopy and the emergency exit.

— The design of the equipment installation must take into account the structural integrity of the instrument panel or any other attachment point. Special consideration is necessary for equipment installed at a location behind the occupant(s).

— Data bus/data connectivity between the flight time recorder and other equipment that is ETSO authorised or approved in accordance with point 21.A.305 is not allowed.

— The equipment must be suitable for the environmental conditions to be expected during normal operation.

— Instructions and tests defined by the equipment manufacturer have to be followed.

— Perform an electromagnetic interference (EMI) test to assess any interference by the flight time recorder with other systems, provided that the flight time recorder emits transmissions during flight.

— The mounting system may be installed following the provisions of CS-SC105.

Note: Lightweight in-flight recording systems may encompass the information collection and monitoring systems specified in ETSO-2C197. However, in-flight recording systems are not required to be compliant with ETSO-2C197.
4. Limitations

— Any limitations defined by the manufacturer of the flight time recorder apply.

— The flight time recorder cannot be used to substitute logbook record requirements mandated by Commission Regulation (EU) No 965/2012 and Commission Regulation (EU) No 1178/2011 (e.g. points CAT.GEN.MPA.180, FCL.130.S, FCL.710, FCL.720 and FCL.135.A).

— GSM, UMTS, LTE, or similar transmission functions with unknown or more than 100 mW output power shall be switched off during flight.

— The embodiment of this SC cannot affect any other aircraft systems or involve the installation of any new data acquisition points.

5. Manuals

— Amend the AFM with AFMS that contains or references the equipment instructions for operation and any reference to the applicable limitations (refer to paragraph 4 above), as required.

— Amend the Instructions for Continues Airworthiness (ICAs) to establish maintenance actions/inspections and intervals, as required.

6. Release to service

This SC is not suitable for the release to service of the aircraft by the Pilot-owner.

---

Standard Change CS-SC107a

INSTALLATION OF CARBON MONOXIDE DETECTORS

1. Purpose
This SC is for the installation of carbon monoxide (CO) detectors, either as panel-mounted devices, or by a semi-permanent installation of ‘life saver’ badges by the use of adhesives.

The exchange of CO detectors that were installed as part of the type design or other approved installations is not covered by this SC.

Note 1: If the installation requires additional brackets, please also refer to CS-SC105, which may be applied concurrently.

Note 2: CO is a toxic, odourless and tasteless gas produced by the incomplete combustion of fossil fuels. Dangerous levels of CO can be produced by internal combustion engines or by any poorly vented or improperly adjusted fuel-burning appliance. Exposure to CO may cause sickness, headaches, or even death. CO detectors can save a pilot’s life.

2. Applicability/Eligibility
This SC is applicable to aeroplanes that are not complex motor-powered aircraft, to rotorcraft that are not complex motor-powered aircraft, and to any ELA2 aircraft.

3. Acceptable methods, techniques, and practices
For the purpose of this SC, the following definitions apply:
— ‘installer’ means the person who releases the aircraft to service in accordance with AMC M.A.801 (and who carries out this SC);
— ‘panel-mounted’ means that ‘spare, free’ panel holes in the cockpit are used for the mounting;
— ‘unit’ means the ‘detector’ plus the ‘mounting system’.

Installation conditions:
— If the unit is fitted in or near the cockpit, it must not interfere with any cockpit controls, and not obstruct the pilot’s view of the instruments, or the pilot’s external view, or cause a distraction.
— The mounting system must be on the fixed surfaces of the aircraft, i.e. not on any control system components that are subject to motion. There must be no interference with the flight controls.
— Where brackets, clamps and/or attachments are used, care must be taken to ensure that they do not damage the aircraft structure that carries flight loads.
— The equipment mounted on the holding structural provisions, other than for CO badges in occupied areas, should be installed so as to meet the requisite crash load requirements so that the equipment will not detach, or become loose and cause injury to the occupants. For such installations, CS-SC105a should be followed, including the push/pull test requirements.
— The equipment manufacturer’s installation instructions and testing provisions, if any, have to be followed.
— For self-adhesive CO badge detectors:
as they normally are required to be replaced after a certain time in operation, the installation of a backplate is recommended, as the adhesive may interfere with the aircraft structure;

- the installer should record the expiry date of the detector, if any, in EASA Form 123, or in the technical logbook.

Additionally, the following considerations apply:

- As part of applying this SC, the installer shall:
  - define and record the location of the CO detector on the aircraft; and
  - list the acceptable and tested mounting system, its weight, and if it is not a CO badge, the part number or similar identification.

4. Limitations

- Any limitations defined by the equipment manufacturer apply.
- The maximum mass of the unit shall not exceed 300 g.

5. Manuals

- Amend the AFM to reference the operating instructions and the weight of any panel-mounted detectors, as required.
- Amend the Instructions for Continuing Airworthiness (ICAs) in order to:
  - establish recurrent inspections to monitor the condition of the unit by checking the integrity and security of the mounting system. Parts that show signs of deterioration must be rectified or replaced;
  - establish discard intervals if required by the manufacturer.

6. Release to service

The first installation of a CO detector is not suitable for a release to service of the aircraft by the Pilot-owner.

A Pilot-owner can replace CO detection badges by following the AFMS instructions.
Standard Change CS-SC151ab

INSTALLATION OF HEADRESTS

1. **Purpose**

A significant portion of the existing sailplane and powered-sailplane fleet is not equipped with headrests as required by the newer certification specifications. The intention of this SC is to enable the simple adaption and installation of headrests and backrests with integrated headrests that are available for similar designs using established practices.

2. **Applicability/Eligibility**

This SC is applicable to sailplanes and including powered sailplanes as defined in ELA2.

3. **Acceptable methods, techniques, and practices**

   — The headrest and its parts are installed and manufactured according to the design data in compliance with CS 22.788 ‘Headrests’.

   — Modified attachments are assessed or tested against the loads referred to in CS 22.788.

   — Any interference with controls needs to be assessed, and this also applies for the empty seat in the case of a two-seater.

   — Adaptions are made using established repair practices, as described in:
     - the maintenance or repair manual;
     - ‘Kleine Fiberglas Flugzeug Flickfibel’ by Ursula Hänle; and
     - FAA AC 43.13-2B/1B.

4. **Limitations**

N/a

5. **Manuals**

Amend the Instructions for Continuing Airworthiness (ICAs) to establish maintenance actions/inspections and intervals, as required.

6. **Release to service**

This SC is not suitable for the release to service of the aircraft by the Pilot-owner.

---

21 Available under [http://www.dg-flugzeugbau.de/flickfibel-d.html](http://www.dg-flugzeugbau.de/flickfibel-d.html). Also available in English under the title ‘Plastic Plane Patch Primer’.
Standard Change CS-SC152ab

CHANGES TO SEAT CUSHIONS INCLUDING THE USE OF ALTERNATIVE FOAM MATERIALS

1. Purpose

This SC is for the installation of alternative materials in the construction of the seat cushions. For the refurbishment of seats with new seat cushions, alternative foam materials can be used.

2. Applicability/Eligibility

This SC is applicable to aeroplanes that are not complex motor-powered aircraft, to rotorcraft that are not complex motor-powered aircraft, and to any ELA2 aircraft.

This SC is not applicable for installations in/on dynamically tested seats (according to CS 23.562 or equivalent).

Note: In cases of uncertainty, check with the TC or STC holder.

3. Acceptable methods, techniques, and practices

(a) The following standards contain acceptable data: FAA Advisory Circular AC 23-2A, Change 1.

(b) Seat cushions can be changed including using new materials under the following conditions:

(1) The design of exchange seat cushions should follow the geometrical dimensions of the original seat cushions.

(2) If the geometrical dimensions are altered, it must be ensured that access to and egress from the seat will not be altered. On pilot seats, it must be ensured that the new cushion has no influence on the use of any of the controls.

(3) The ‘flame-resistant’ capability of the material installed on aircraft other than gliders, motor-powered gliders, LSA, and balloons must be demonstrated. The ‘flame-resistant’ capability can be demonstrated by:

(i) compliance with the ‘flame-resistance’ requirements proven by means of FAA AC 23-2A Change 1 §8 b, or equivalent, and documented by appropriate test reports released by the material suppliers; or

(ii) compliance with any other more stringent flammability tests (e.g. the vertical tests of FAR/CS-25 Appendix F); or

(iii) the successful execution of the following ‘Flame Resistant’ test, referenced or recorded in EASA Form 123:

‘Flame Resistant’ test

(A) Test specimens. Three specimens, approximately 4 inches wide and 14 inches long, should be tested. Each specimen should be clamped in a metal frame so that the two long edges and one end are held securely. The frame should be such that the exposed area of the specimen is at least 2 inches wide and 13 inches long, with the free end at least 0.5 inches from the end of frame for ignition purposes. In the case of fabrics, the direction of the weave corresponding to the most critical burn rate should be parallel to the 14-inch dimension. A minimum of 10 inches of the specimen should be used for timing purposes, and approximately 1.5 inches should burn before the burning front reaches the timing zone. The specimen should be long enough so that the timing is stopped at least 1 inch before the burning front reaches the end of the exposed specimen.
3. Proposed amendments and rationale in detail

(B) Test procedure. The specimens should be supported horizontally and tested in draft-free conditions. The surface that will be exposed, when installed in the aircraft, should face downwards for the test. The specimens should be ignited by a Bunsen or Tirrill burner. To be acceptable, the average burn rate of the three specimens must not exceed 4 inches per minute. Alternatively, if the specimens do not support combustion after the ignition flame is applied for 15 seconds, or if the flame extinguishes itself and subsequent burning without a flame does not extend into the undamaged areas, the material is also acceptable. (Federal Specification CCC-T-191b, Method 5906, may also be used for testing materials of this type, but the material should not exceed the above-mentioned 4-inches-per-minute burn rate.)

For aeroplanes, all materials used in the construction of seat cushions must be flame resistant. Flame resistance can be demonstrated according to FAA Advisory Circular AC 23-2A, or, alternatively, such materials must pass the flammability test according to Appendix F, Part I of CS-25 (see FAA Advisory Circular AC 23-17C, paragraph 23.853). Each material used in the construction of seat cushions must meet the above flammability tests separately.

Materials (including foam materials) that will be used in sailplanes or powered sailplanes do not have to meet flammability requirements.

To improve occupant safety, it is recommended to use energy-absorbing foams in the construction of seat cushions. Energy-absorbing foam materials have the potential to reduce the possibility of spinal injuries in cases of hard landings or minor crash landings.

Additionally, the following applies:

— The design of exchange seat cushions should follow the geometrical dimension of the original seat cushion.

— In case the geometrical dimensions are altered, it must be ensured that access to and egress from the seat will not be altered. On pilot seats, it must be ensured that the cushion has no influence on the use of any of the controls.

4. Limitations

N/a

5. Manuals

N/a

6. Release to service

This SC may be released by the Pilot-owner subject to compliance with AMC M.A.801 and only in the case of sailplanes, and including powered sailplanes.
Standard Change CS-SC201ab

EXCHANGE OF POWERPLANT INSTRUMENTS

1. Purpose
This SC is for the exchange of powerplant instruments with new ones, and it is applicable to:
   - temperature instruments;
   - fuel and oil quantity instruments;
   - fuel flowmeters;
   - manifold pressure instruments;
   - tachometers (rpm RPM);
   - pressure instruments; and
   - carbon monoxide detector instruments.
This SC does not permit the installation of digital multifunction displays.

2. Applicability/Eligibility
This SC is applicable to piston-engined aeroplanes with MTOMs of less than 2 730 kg, and to ELA2 aircraft.

3. Acceptable methods, techniques, and practices
The following standards contain acceptable data:
Additionally, the following conditions apply:
   - The instrument is authorised according to the applicable ETSO/JTSO or equivalent;
   - The instrument has the same minimum functionality, is installed at the same in a similar location, and is compatible with the existing installation;
   - The display of information is consistent with the overall flight deck design philosophy;
   - The instrument is suitable for the environmental conditions to be expected during normal operation;
   - The indicators have the required markings (e.g. limits, operating ranges) that were required on the original instrument;
   - The selection/calibration of the instrument must be such that, under the same conditions, the indications provided by the old and the new instrument are the same;
   - The instructions and tests defined by the instrument manufacturer have to be followed, and
   - The instrument should provide the measurement of the related magnitude in the same units as the exchanged instrument for which it was exchanged, or in other units when such units are used in the AFM, and the related placards have been updated as necessary.

4. Limitations
Any limitations defined by the instrument manufacturer apply.
Any limitations of the existing installation remain valid.

5. **Manuals**

Amend the AFM with AFMS that containing or referencing the instrument’s instructions for operation, as required.

Amend the Instructions for Continuing Airworthiness (ICAs) to establish maintenance actions/inspections and intervals, as required.

6. **Release to service**

This SC is not suitable for the release to service of the aircraft by the Pilot-owner.
Standard Change CS-SC206a

EXCHANGE OF FIXED PITCH WOODEN PROPELLERS

1. Purpose

This SC is for the exchange of fixed pitch wooden propellers.

2. Applicability/Eligibility

This SC is applicable to ELA2 aeroplanes with fixed pitch wooden propellers.

3. Acceptable methods, techniques, and practices

The following standards contain acceptable data:
— The propeller manufacturer’s installation instructions and testing, if any, have to be followed.

Additionally, the following conditions apply:
— The number of blades, the mass, speed, diameter, gradient, twist, cord and tip shape of the new propeller must be the same as those of the original propeller, or must be permitted by the following Table 1 ‘maximal tolerances’ in respect of the original propeller.

<table>

Table 1 — Maximal tolerances

— The new propeller shall be type-certified by EASA.

— A reissue of the Noise Certificate (EASA Form 45) by the competent authority is required.

The installer has to coordinate with the EASA Noise Department to ensure that the Noise Database is updated by sending the following information to noise@easa.europa.eu:
— the designation of the propeller,
— its diameter, and
— its pitch.

On EASA Form 45, state under ‘Remarks’: ‘Propeller similarities demonstrated in accordance with CS-STAN CS-SC206a.’
3. Proposed amendments and rationale in detail

4. Limitations

Any limitations defined by the propeller manufacturer apply.

5. Manuals

Amend the AFM with AFMS that contains or references the operating instructions for the propeller, as required.

Amend the Instructions for Continuing Airworthiness (ICAs) to establish maintenance actions/inspections and intervals, as required.

6. Release to service

This SC is not suitable for the release to service of the aircraft by the Pilot-owner.
Standard Change CS-SC207a
EXCHANGE OF HOT-AIR BALLOON FUEL CYLINDERS

1. Purpose
This SC is for the exchange of hot-air balloon fuel cylinders.

2. Applicability/Eligibility
This SC is applicable to hot-air balloons as defined in ELA1, which are used in non-commercial operations.

3. Acceptable methods, techniques, and practices
The following considerations apply:
— The new fuel cylinder must be part of an EASA-approved balloon type design.
— The fuel cylinder must be airworthy.
— The installation must take into account the approved configuration in accordance with the respective FM.
— The installation must take into account any interference with other equipment.
— The design of the equipment installation must take into account the structural integrity of the attachment point. Therefore, the new cylinder must not be heavier than the one that was originally installed.

4. Limitations
— Any limitations defined by the fuel cylinder manufacturer apply.
— The new fuel cylinder must be compatible with the existing fuel hose connectors.
— Modifications of the fuel cylinder, or the fuel system, are not permitted.

5. Manuals
The FM Supplement must, at least, contain:
— a description of the system, its operating modes and its functionality;
— its limitations and warnings;
— the normal and emergency operating procedures

The OEM’s instructions for the exchanged fuel cylinder, for continued airworthiness, and for airworthiness limitations, remain applicable and must be applied.

6. Release to service
This SC may be released by the Pilot-owner subject to compliance with AMC M.A.801.
Standard Change CS-SC401bc

EXCHANGE OF BASIC FLIGHT INSTRUMENTS

1. Purpose

This SC is for the exchange of basic flight instruments with new equipment, and it is applicable to:

- airspeed instruments;
- turn and slip instruments;
- bank and pitch instruments;
- direction instruments;
- vertical velocity instruments;
- clocks; and
- pressure-actuated altimeter instruments.

This SC does not permit the installation of digital multifunction displays. However, a combination of turn and slip with bank and pitch in one display is acceptable.

2. Applicability/Eligibility

This SC is applicable to aeroplanes that are not complex motor-powered aircraft, to any ELA2 aircraft with a maximum flight altitude below FL 280, and to sailplanes, including powered sailplanes or balloons being ELA2 aircraft with a maximum flight altitude below FL 280.

It is also applicable to rotorcraft that are not complex motor-powered aircraft, which have a single piston engine, and which are limited to day VFR only.

In the case of rotorcraft:

- if the rotorcraft is approved for NVIS, the change cannot be considered an SC;
- if the instrument is to be connected to the AFCS, the change cannot be considered to be an SC.

3. Acceptable methods, techniques, and practices

The following standards contain acceptable data:

Additionally, the following conditions apply:

- With the exception of clocks, the instrument is authorised according to the applicable ETSO/JTSO or equivalent;
- The instrument has the same functionality, is installed at the same location, and the display of information is consistent with the overall flight deck design philosophy;
- The instrument is suitable for the environmental conditions to be expected during normal operation;
- The indicators have the required markings (e.g. limits, operating ranges) that were required on the original instrument;
- The selection/calibration of the instrument must be such that, under the same conditions, the indications provided by the old and the new instrument are the same.
— The instructions and tests defined by the equipment manufacturer have to be followed; and
— The new instrument should provide the measurement of the related magnitude in the same units as the instrument for which it was exchanged; or in other units when such units are used in the AFM, and the related placards have been updated as necessary.

4. Limitations
Any limitations defined by the instrument manufacturer apply.

Any limitations of the existing installation remain valid.

In the case of aircraft that are approved for NVIS/NVG, if cockpit panels are to be inserted, the change cannot be considered to be an SC.

5. Manuals
Amend the AFM with AFMS that containing or referencing the operating instructions for the instrument’s instructions for operation, as required.

Amend the Instructions for Continues Airworthiness (ICAs) to establish maintenance actions/inspections and intervals, as required.

6. Release to service
This SC is not suitable for the release to service of the aircraft by the Pilot-owner.
SUBPART C — STANDARD REPAIRS

LIST OF STANDARD REPAIRS

CS-SR801a — Aircraft Repair according to FAA Advisory Circular AC 43.13-1B
CS-SR802 — Repair of sailplanes including powered sailplanes, LSA and VLA
CS-SR803a — Temporary repair of canopy cracks by drilling a stopping hole
CS-SR804a — Use of alternative adhesive for repairs of wood and wooden mixed structures
Standard Repair CS-SR802bc

REPAIR OF SAILPLANES INCLUDING POWERED SAILPLANES, LSA AND VLA

1. Purpose
This SR is issued to allow the use of established practices for the repair of metal, composite, wood and mixed structures of light aircraft.

2. Applicability/Eligibility
This SR is applicable to sailplanes, including powered sailplanes (as defined in ELA2), LSA, and VLA.

3. Acceptable methods, techniques, and practices
Any of the following standards contain acceptable data:
for composite structures:
— ‘Kleine Fiberglas Flugzeug Flickfibel’ by Ursula Hänle, and
— Seminardruck ‘Faserverbundwerkstoffe im Segelflugzeugbau’, Fortbildungsseminar des DAeC;
for wooden and mixed structures on sailplanes including powered sailplanes:
— R.C. Stafford-Allen ‘Standard Repairs to Gliders’ by the British Gliding Association, or
— ‘Werkstattpraxis für den Bau von Gleit- und Segelflugzeugen’ by Hans Jacobs;
for skin only:
for general purposes:

4. Limitations
— The person responsible for the design of the repair must be familiar enough with the applicable airworthiness requirements to determine that the repair data developed from the references in paragraph 3 above is appropriate to the product being repaired.
— Where suitable TC holder approved repair data exists, this should be used before an SR is considered.

22 Available under http://www.dg-flugzeugbau.de/flickfibel-d.html. Also available in English under the title ‘Plastic Plane Patch Primer’.
23 Available under https://members.gliding.co.uk/library/standard-repairs-to-gliders
24 ‘indice B’ contains changes agreed with EASA, subsequent amendments shall be used only if referred to in CS-STAN.
For bonded repairs, the SR should not exceed a size above which the limit load cannot be sustained if the repair fails, unless the person responsible for the repair is sufficiently experienced with the design data, materials, process, repair size and aircraft configuration.

**Note:** Where there is any doubt as to whether following the references in paragraph 3 will result in compliance with the applicable requirements, instead of applying this SR, a repair design approval in accordance with Part 21 should be obtained. Particular attention should be paid to repair designs where there is a risk of adversely affecting fatigue or aeroelastic characteristics, and the recommendations of the references should be followed.

5. **Manuals**

Assess whether the repair could require the issue of an AFMS.

Amend the Instructions for Continuing Airworthiness (ICAs) to establish maintenance actions/inspections and intervals, as required.

6. **Release to service**

This SR is not suitable for the release to service of the aircraft by the Pilot-owner.
4. Impact assessment (IA)

There is no need to develop an IA, in accordance with EASA MB Decision No 18-2015, as this NPA has been prepared in the framework of a regular update of CS-STAN.
5. **Proposed actions to support implementation**

CS-STAN is part of the EASA GA Roadmap, therefore, whenever possible, EASA will advertise the amendments introduced by CS-STAN Issue 3 at each GA Roadmap related event.

Additionally, the following topics have been created within EASA’s recently launched GA Community site:\[26\]:

- CS STAN Evolution;
- CS-STAN FAQ.

The first topic is expected to support discussions about new subjects to be addressed by means of CS-STAN, as well as improvements to the existing standard changes and standard repairs.

The second topic is expected to support the sharing of experience and best practices related to the implementation of existing standard changes and standard repairs.
