(a) One pilot amongst the flight crew shall be designated by the operator as pilot in command:

(b) The operator shall only designate a flight crew member to act as pilot in command:

if

he/she:

(1) complies with the minimum level of experience specified in the Operations Manual;

(2) except in the case of balloons:

(i) has adequate knowledge of the route or area to be flown and of the aerodromes, facilities and procedures to be used;

(ii) in the case of commercial operations, has had experience within the last 12 months of the route or area to be flown and of the aerodromes, facilities and procedures to be used;

(3) in the case of multicrew

operations, has completed a command course provided by the operator, as specified in the Operations Manual;

**Comment:**

The requirement in OR.OPS.020.FC (3) (to have completed a command course) is far more restrictive than the corresponding EU-OPS paragraph on in-flight relief of flight crew members which allows the PIC to be relieved by another suitable qualified flight crew member which does not need to be a Commander above FL200.

This EASA proposal, which is not line with EU-OPS. neglects decades of safe operations based on the existing rules. It has no safety justification and would lead to an unacceptable increase in crew cost. It will lead to business shifting to non-EU airlines.

**Proposal:**

Realign the in-flight relief requirements for flight crew with the provisions of EU-OPS (Appendix 1 to EU-OPS.1.940) through a simple copy and paste of the EU-OPS provisions into the corresponding EASA Implementing Rules

comment by: *FNAM (Fédération Nationale de l'Aviation Marchande)*

**Comment**

The requirement to have to complete a command course for a pilot to relief the PIC is a way too much strict. This does not match with EU-OPS requirements and would lead to a huge increment in costs for operators.

**Proposal**

EU-OPS must remain unchanged regarding inflight relief of crew members.

**Justification**

This change would lead to cost increment without any safety improvement.

3422

comment by: *UK CAA*

**Page No:** 13

**Paragraph No:**

OR.OPS.020.FC(b)(3)

**Comment:**

The way this has been written indicates that a pilot who joins an operator when previously already qualified as a pilot-in-command (PIC) with his previous operator **must** complete another command course with the new operator prior to being able to be designated as PIC by the new operator. This is a direct copy of what is written in EU-OPS but is not logical. The way this requirement is written in JAR-OPS 3.955 is a clearer way of writing the requirement.

**Justification:** Clarity of requirement and the removal of ambiguity.

**Proposed Text (if applicable):** Replace current (b)(3) with the following text;

(3) *In the case of multi-crew operations the pilot-in-command has;*  
 (i) *completed an operator's command course if upgrading from co-pilot to pilot-in-command, or*  
 (ii) *already qualified as a pilot-in-command if joining the operator as a direct entry pilot-in-command.*

comment

comment by: IATA

**(b) The operator shall only designate a flight crew member to act as pilot in command if he/she:**

**(1) .....**

**(2) .....**

**(i) .....**

**(ii) .....**

**(3) in the case of multi crew operations, has completed a command course provided by the operator, as specified in the Operations Manual;**

**Comment:**

The requirement for a command course does imply the need for multiple commanders on e.g. long haul flights. Current EU-OPS rules are less demanding.

Under the current system of the EU-OPS there's a possibility to relieve a function above FL200 with less demanding qualifications. The current system has been used for many years and there's no evidence that this poses a safety risk.

The Basic Regulation (BR) allows for issuing a limited license, including limited training and checking;

Basic Regulation (BR) Article 7 gives room for pilot with a limitation, translated into FCL.015

BR) Annex III, Article 1d Practical skill explicitly states; if appropriate to the functions exercised on the aircraft

BR) Annex III, Article 1.e explicitly states; appropriate to the functions exercised on the aircraft

**Proposal:**

**Delete the command course requirement.**

**Revert to EU-OPS principle where a Rating and ATPL was required to relieve the commander.**

(b)(3)

OR.OPS.020.FC Designation as pilot-in-command (b)(3), OR.OPS.115.FC Composition of Flight Crew (b) and OR.OPS.120.FC Command course are interlinked but have a significant effect when related to Augmented Crew Operation. EASA have chosen not to use the term 'Commander' which was utilised by the JAA to differentiate between pilots who were licensed to be in command but were not nominated as pilot-in-command. EASA reasoning is that ICAO do not use the term. However in the JAA/EU-OPS/EASA world there is an anomaly in that in some states a pilot is rated in his license automatically as Pilot-in-command [or co-pilot] UK,EIRE being 2 but there are others. The remaining States rate a Pilot as Co-Pilot OR pilot-in-command. Thus in these states [UK,EIRE etc] a Cruise relief Captain [co-pilot with pilot-in-command privileges] need only have such training as decided by the Operator. Those other States have to give a co-pilot a LHS OPC [as it stands at this time]. This procedure is adopted in Germany/France and other states.

The consequence of EASA's planning is to require a relief Captain to be a Captain and no longer a Co-Pilot with pilot-in-command privileges and appropriate training as decided by the operator.

EASA indicates that the relieving Pilot has total command of the aircraft, which is not true as the 'Commander' is still legally responsible for the flight. In a 2 man crew, when the Captain goes to the toilet, the F/O becomes the Pilot flying, but the Captain [Commander] is still legally responsible. The AMC should clarify that there is only one pilot-in-command, who retains the final decision during the entire flight, even when relieved by another pilot [e.g. cruise relief captain] for the conduct of the flight. [Excepting the formal hand-over in flight of command authority from one "commander" to another in ultra long range operations where two flight crews are required to enable the aircraft to remain airborne beyond what hitherto has been agreed as an acceptable flight duty period. The off-duty crew can therefore obtain uninterrupted and recuperative rest.] The pilot-in command status is not related to pilot-flying/pilot-not-flying, but identifies the flight crew member as being the "final authority" on board.

The outcome of this is that there will be increased crew costs but without any proven increase in Safety. If the current system is unsafe then it should be stopped immediately not wait until EASA regulations become law.

Proposal:

1. Use EU-OPS Appendix 1 to EU-OPS 1.940
2. Reinstate the term 'Commander' as per EU-OPS 1.940 (a) 5 to avoid confusion

comment by: *British Airways*

**Section:**

OR.OPS.020. Designation as Pilot-in-Command  
and

AMC.OR.OPS.015 FC (d) Composition of flight crew (In-Flight Relief of Flight Crew Members)

**Relevant Text:**

AMC OR.OPS.015.FC (d) Composition of flight crew

INFLIGHT RELIEF OF FLIGHT CREW MEMBERS AEROPLANES

A flight crew member should be considered suitably qualified to relieve another flight crew member of his duties at the controls in flight in the following cases:

1 The pilot in command may delegate the conduct of the flight to another qualified pilot provided the relieving pilot in command:

- a. holds the appropriate type or class rating;
- b. meets the applicable recent experience requirements for pilots in command as specified in FCL.060;
- c. meets the relevant qualifications prescribed in OR.OPS.020.FC, such as minimum level of experience, command course, competence regarding area, route, aerodrome, facilities and procedures; and
- d. meets any other requirements which the operator may have established for that purpose.

And from OR.OPS.020.FC to which it refers in sub para (c):

OR.OPS.020.FC Designation as pilot in command

(a) One pilot amongst the flight crew shall be designated by the operator as pilot in command:

(b) The operator shall only designate a flight crew member to act as pilot in command:

if he/she:

(1) complies with the minimum level of experience specified in the Operations Manual;

(2) except in the case of balloons:

(i) has adequate knowledge of the route or area to be flown and of the aerodromes, facilities and procedures to be used;

(ii) in the case of commercial operations, has had experience within the last 12 months of the route or area to be flown and of the aerodromes, facilities and procedures to be used;

(3) in the case of multicrew

operations, has completed a command course provided by the operator, as specified in the Operations Manual;

**Comment:**

The requirement in OR.OPS.020.FC (3) (to have completed a command course) is far more restrictive than the corresponding EU-OPS paragraph on in-flight relief of flight crew members which allows the PIC to be relieved by another suitably qualified flight crew member which that does not need to meet the requirements to be a Commander above FL200.

This EASA proposal, which is a significant departure from EU-OPS law, neglects decades of safe operations based on the existing rules. There is no current safety justification for this requirement and no RIA has been carried out. Implementation of this rule would lead to an unacceptable increase in crew costs for EASA airlines with a corresponding reduction on competitiveness in this global industry. It will lead to business shifting to non-EU airlines.

**Proposal:**

Realign the in-flight relief requirements for flight crew with the provisions of EU-OPS (Appendix 1 to EU-OPS.1.940) through a simple copy and paste of the EU-OPS provisions into the corresponding EASA Implementing Rules

- when **changing** operator (acc EU-OPS), and
  - when **commencing at an** operator...
- as in the proposed text?

comment 861

comment by: *ECA - European Cockpit Association*

Comment on OR.OPS.035.FC: insert as new (a) and renumber the subsequent paragraphs accordingly:

**An operator shall ensure that a flight crew member completes a Type Rating course which satisfies the requirements applicable to the issue of Flight Crew Licences when changing from one type of aeroplane to another type or class for which a new type or class rating is required.**

Justification:

In the EU/JAR context, in commercial operations the operator was obliged to ensure that a crew member had completed a Type Rating Course when changing types. In the EASA system this responsibility is now transferred implicitly to FCL and the individual pilot. There are social implications with this change, as an operator could force a pilot to fly on one type until the day the pilot shall commence flying the new type. Without any duty days allocated for the completion of the type rating, which could be in line with social contracts and laws, this will lead to a double burden for pilots, reducing safety.

Recurrent training / annual check

Due to the high number of checks it shall be possible to combined with PPC or other related checks in accordance with the National Authority. Flight crew undergo 14 checks : HELO recency, NVIS (3 missions in 90 days), HHO (3 night hoist cycle in 90 days), HEMS (30 minutes IFR in 6 months), HEMS VMC prof check, HEMS Night prof check, HEMS line check, Recurrent training on each type, CRM annual check, OPS prof. check (check valid 6 months), Emergency and safety check (annual), Ground training (annual), Commercial OPS other than CAT (annual check), dangerous check (2 years).

comment 479 comment by: *Heli Gotthard*

comment 655 comment by: *AEA*

**Relevant Text:**

Each flight crew member shall complete annual recurrent aircraft flight and ground training relevant to the type or variant of aircraft on which he/she operates, including training on the location and use of all emergency and

safety equipment carried.

**Comment:**

This proposal is more demanding than EU OPS ( Appendix 1 to OPS 1.965 (a)(3)) which distinguishes between safety equipment to be trained every year (such as for example actual handling of fire extinguishers etc) and safety equipment to be trained every 3 years (such as for example the actual operation of all type of exits etc). This is unacceptable since EASA has not produced a Regulatory Impact Assessment and associated safety case which would justify a change to the existing provisions of EU-OPS.

**Proposal:**

Realign with EU-OPS Appendix 1 to OPS 1.965 (a)(3)

There should not be a requirement for specific training and checking in case of in-flight relief (above FL200).

**Proposal:**

Amend the paragraph to read as 'Flight crew members who may be assigned in either pilot's seat **below FL200** shall complete appropriate training and checking as specified in the operations manual.

comment by: *ECA - European Cockpit Association*

Comment on OR.OPS.050.FC: Add text from App 1 EU-OPS 1.968:

Pilot qualification to operate in either pilot's seat

(a) Commanders whose duties also require them to operate in the right-hand seat and carry out the duties of co-pilot, or commanders required to conduct training or examining duties from the right-hand seat, shall complete additional training and checking as specified in the Operations Manual, concurrent with the operator proficiency checks prescribed in JAR-OPS 1.965(b). This additional training must include at least the following:

- (1) An engine failure during take-off;
- (2) A one engine inoperative approach and go-around; and
- (3) A one engine inoperative landing.

(b) When engine-out manoeuvres are carried out in an aeroplane, the engine failure must be simulated.

(c) When operating in the right-hand seat, the checks required by JAR-OPS for operating in the left-hand seat must, in addition, be valid and current.

(d) A pilot relieving the commander shall have demonstrated, concurrent with the operator proficiency checks prescribed in OPS 1.965(b), practice of drills and procedures, which would not, normally, be the relieving pilot's responsibility. Where the differences between left and right seats are not significant (for example because of use of autopilot) then practice may be conducted in either seat.

(e) A pilot other than the commander occupying the left-hand seat shall demonstrate practice of drills and procedures, concurrent with the operator proficiency checks prescribed in OPS 1.965(b), which would otherwise have been the commander's responsibility acting as pilot non-flying. Where the differences between left and right seats are not significant (for example because of use of autopilot) then practice may be conducted in either seat.

Justification:

The combination of different EU-OPS sentences makes this text ambiguous. This could be understood in a way that the training content will be specified by each operator individually on AMC level, while the intention is that the content is according App 1 EU-OPS 1.968, which is then repeated in the OM. Ambiguities like these are not allowed in EU law.

Downgrading of these requirements to AMC is not acceptable.

145

comment by: *EHOc*Missing Rule (post the one shown)

It is not clear why 'Training Records' has been transferred to the MLR section from the training section. Whilst it is a record of training, it is an instruction to the operator about the recording and availability of these records rather than an instruction for the storage (which is contained in the immediate section above).

It should be returned to the FC section:

"OR.OPS.065.FC Training records

The operator shall:

(a) Maintain records of all training, checking and qualification prescribed in this Section undertaken by a flight crew member; and

(b) Make the records of all conversion courses and recurrent training and checking available, on request, to the flight crew member concerned."

comment by: *Southern Cross International*

Due to the type of operations of our company (test and ferry flights) and taking into consideration the wide variety of aircraft operated by our company, the different equipment fits for each of those aircraft, the extreme short period of time those aircraft are operated, and the fact that the majority of our crews are employed on a contract per flight basis, requiring an operator training program is not practicable as these crew members will be compliant with the training programme established by their regular employer for the subject type of aircraft. See also OPS.SPA.020.GEN (b)

comment by: *DGAC*

In b), what is the meaning of « flight training »?

It should be clarified that this is only applicable to proficiency checks

If it includes line checks, there is a problem, as EU-OPS and section 2 of JAR-OPS 1 as updated and included in our "IOPS" allows for a PIC who is not an instructor to conduct line-checks. Part FCL requires that it is a TRI/CRI/SFI.

### Relevant Text

NPA 2009-02 **A** Explanatory Notes / Appendix II / Explanatory Memorandum to Subpart OR.OPS  
Footnote 29

Finally, EU-OPS 1.978, which allows operators to establish alternative training and qualification programmes, was not transposed as such a flexibility is already built in the new set of rules since the training requirements are now AMC material and the right to deviate that was necessary in the EU-OPS framework is not needed any more. In this new context, if an operator wants to develop a training programme that does not follow the related AMC, it will have to use the mechanism foreseen in Part-AR and Part-OR to deal with alternative means of compliance.

### Comment:

*This statement neglects to take into consideration the full extent of EU-OPS 1.978. EU-OPS 1.978 not only allows for flexibility in the training programme but in addition prescribes an alternative schedule for checking under which 12*

*month OPC validity, 24 month Line Check validity and 24 month SEP validity periods may be approved.*

NPA 2009-02C OR.OPS and AMC.OR.OPS, does not include any facility that allows training and checking under an Alternative Training and Qualification Program (ATQP) as is stated in the current EU-OPS 1.978 Alternative Training and Qualification Program.

The omission of this alternative checking schedule would have a significantly negative impact on the flight crew training of Swiss international Air Lines. To establish an ATQP training program requires effort regarding all kind of resources. Without the integrated enhanced validity periods allocating of resources in the required extend could not be justified. We argue that an ATQP program is an amalgam of both training AND checking and that enhanced validity periods are integral to the package. Currently note 29 refers only to the training element.

We don't believe it was the intent of the EU Legislator when tasking EASA to prepare the Implementing Rules to omit this regulation and there is no safety justification for this change.

### **Rationale and Proposal for an ATQP under OR.OPS.xx.FC**

ATQP program in Swiss International Air Lines has a proven safety benefit demonstrated

An Operator can via the ATQP administer a wider specter of training, focusing on specific skills or knowledge that the Flight Crew should master, equaling or increasing the overall Flight Crew performance compared with the performance obtained pre-ATQP. The ATQP enables Swiss International Air Lines to adapt the training needs and optimize time and money spent on expensive Full Flight Simulators. The ability within the ATQP to fit the training needs of different aircraft types makes the ATQP unsurpassed as training program compared to the traditional rule based training program it is complementing.

EU-OPS is strictly defining the training program, both contents and intervals that Operators must follow for training and checking of Flight Crew. The rules have hardly been changed the last 10 years.

However, new technology, aircraft, navigation equipment, infrastructure and training aids have been continuously developed and this should somehow be included in the training program.

The one and only opportunity addressing these issues of tailored training adaptations under the current regulations is via the EU-OPS 1.978 Alternative Training and Qualification Program.

Training performed under ATQP has a tremendous Safety Benefit to the Operators, as proven in their individual safety cases. The Operator must fulfill strict entry requirements before entering an ATQP, in example a Safety Case, Task Analysis, LOE, LOQE, Feedback Loop and a FDM program. This ensures a standard not less than would be achieved under the requirements of OR.OPS, even when extending the validity periods of some of the requirements of OR.OPS, and replacing some OR.OPS regulated training by valuable operator specific training for crews.

Most of the content in the current EU-OPS will be transported into the new EASA OPS. The Operators must rewrite their Operation Manuals according to the new EASA OPS structure, but the content is more or less the same. In this context it is regrettable that the provisions found in EU-OPS 1.978, according to the NPA is not planned transported into the EASA OPS.

*The NPA in its current version is effectively shutting down all ATQP implemented throughout Europe without offering solutions on how such a superior training program can run under the new EASA OPS.*

### **ATQP Program of Swiss International Air Lines**

History: Swiss (air) started with the preparation for an ATQP in 2000

Early versions of JAR-OPS had provisions for AQP, but lacked guidance for how the program should look like. This is one of the reasons, why the former Swissair and Swiss International Air Lines were set back in going live with its program.

Later revisions of JAR-OPS 1 changed the AQP into ATQP and included appendixes, AMC/ACJ and IEM. The Operators now have the means for developing, under the supervision of the authorities, a functioning ATQP.

Swiss developed and approved the required components ongoing  
(See Table 1 Appendix A)

#### **Milestones:**

Date of issue	Content	Aircrafts	Training	Extended Validity
1. January 2008	FOCA provided Letter of authorization based on the requirements of JAR OPS 1.987	A319,A320,A321, A330, A340	OPC ESET Line Checks CRM	NIL
1. January 2009	FOCA provided Letter of approval based on the requirements of JAR OPS 1.987	A319,A320,A321, A330, A340	OPC ESET Line Checks CRM	OPC ESET Line Checks CRM

Swiss International Air Lines is therefore suggesting that the ATQP shall be continued as stated in EU-OPS 1.978 as an option for Operators for administering Flight Crew training and checking.

The complete EU-OPS 1.978 text, including appendix, shall be copied into EASA OPS. (Former JAR-OPS 1 Part into the Law Part of EASA Framework and Appendixes into AMC part).

Swiss International Air Lines therefore requests that FOCA further on is enabled to approve the ATQP Programme including the authorization of extended validity periods of

- (1) Operator proficiency check**
- (2) Line Check**
- (3) Emergency and Safety equipment checking**

Details as stated below

**Proposal:**

Include the following (new) regulation and associated AMC:

**AMC OR.OPS.xx.FC - Alternative training and qualification programme**

- (a)** An operator, following a minimum of two years continuous operations, may substitute the training and checking requirements for flight crew specified in OR.OPS by an Alternative Training and Qualification Programme (ATQP) approved by the Competent Authority. The two years continuous operations may be reduced at the discretion of the Competent Authority.
- (b)** The ATQP must contain training and checking which establishes and maintains a level of proficiency demonstrated to be at least not less than the level of proficiency achieved by following the provisions of OR.OPS. The standard of flight crew training and qualification shall be established prior to the introduction of ATQP; the required ATQP training and qualification standards shall also be specified.
- (c)** An operator applying for approval to implement an ATQP shall provide the Competent Authority with an implementation plan.
- (d)** In addition to the checks required by OR.OPS an operator shall ensure that each flight crew member undergoes a Line Orientated Evaluation (LOE).
- (1) The Line Orientated Evaluation (LOE) shall be conducted in a simulator. The LOE may be undertaken with other approved ATQP training.
  - (2) The period of validity of an LOE shall be 12 calendar months, in addition to the remainder of the month of issue. If issued within the final 3 calendar months of validity of a previous LOE the period of validity shall extend from the date of issue until 12 calendar months from the expiry date of that previous LOE.
- (e)** After 2 years of operating within an approved ATQP an operator may, with the approval of the Authority, extend the periods of validity as defined in OR.OPS as follows:
- (1) Operator proficiency check - 12 calendar months in addition to the remainder of the month of issue. If issued within the final 3 calendar months of validity of a previous operator proficiency check, the period of validity shall extend from the date of issue until 12 calendar months from the expiry date of that previous operator proficiency check.
  - (2) Line Check - 24 calendar months in addition to the remainder of the month of issue. If issued within the final 6 calendar months of validity of a previous line check, the period of validity shall extend from the date of issue until 24 calendar months from the expiry date of that previous line check. The line check may be combined with a Line Oriented Quality Evaluation (LOQE) with the approval of the Competent Authority.

(3) Emergency and Safety equipment checking – 24 calendar months in addition to the remainder of the month of issue. If issued within the final 6 calendar months of validity of a previous check, the period of validity shall extend from the date of issue until 24 calendar months from the expiry date of that previous check.

(f) The ATQP shall be the responsibility of a nominated post holder.

#### **AMC.OR.OPS.~~xx~~.FC Alternative Training and Qualification Program**

(a) An operator's ATQP may apply to the following requirements that relate to training and qualifications:

- (1) Low Visibility Operations – Training and Qualifications
- (2) Conversion training and checking
- (3) Differences training and familiarisation training
- (4) Nomination as commander
- (5) Recurrent training and checking
- (6) Pilot qualification to operate in either pilots's seat
- (7) Operation on more than one type or variant

(b) Components of the ATQP - An Alternative Training and Qualification Programme shall comprise the following:

- (1) Documentation that details the scope and requirements of the programme;
- (2) A task analysis to determine the tasks to be analysed in terms of:
  - (i) knowledge;
  - (ii) the required skills;
  - (iii) the associated skill based training; and
  - (iv) where appropriate, the validated behavioural markers.
- (3) Curricula – the curriculum structure and content shall be determined by task analysis, and shall include proficiency objectives including when and how those objectives shall be met. The process for curriculum development shall be acceptable to the Competent Authority;
- (4) A specific training programme for:
  - (i) each aeroplane type/class within the ATQP;
  - (ii) the instructors (Class rating instructor rating/Synthetic flight instructor authorisation/Type rating instructor rating - CRI/SFI/TRI), and other personnel undertaking flight crew instruction;
  - (iii) the examiners (Class rating examiner/Synthetic flight examiner/Type rating examiner - CRE/SFE/TRE); to include a method for the standardisation of the instructors and examiners;
- (5) A feedback loop for the purpose of curriculum validation and refinement, and to ascertain that the programme meets its proficiency objectives;
- (6) A method for the assessment of flight crew both during conversion and recurrent training and checking. The assessment process shall include event-based assessment as part of the LOE. The method of assessment shall comply with the provisions of OR.OPS;
- (7) An integrated system of quality control, that ensures compliance with all the requirements, processes and procedures of the programme;
- (8) A process that describes the method to be used if the monitoring and evaluation programmes do not ensure compliance with the established

proficiency and qualification standards for flight crew; and  
 (9) A Data Monitoring/Analysis programme.

**(c)** Implementation - The operator shall develop an evaluation and implementation strategy acceptable to the Authority; the following requirements shall be fulfilled:

(1) The implementation process shall include the following stages:

(i) A safety case that substantiates the validity of:

(A) The revised training and qualification standards when compared with the standards achieved under OR.OPS prior to the introduction of ATQP.

(B) Any new training methods implemented as part of ATQP.

If approved by the Competent Authority the operator may establish an equivalent method other than a formal safety case.

(ii) Undertake a task analysis as required by paragraph (b)(2) above in order to establish the operator's programme of targeted training and the associated training objectives;

(iii) A period of operation whilst data is collected and analysed to ensure the efficacy of the safety case or equivalent and validate the task analysis. During this period the operator shall continue to operate to the pre-ATQP OR.OPS requirements. The length of this period shall be agreed with the Competent Authority;

(2) The operator may then be approved to conduct training and qualification as specified under the ATQP.

If the proposed text to an OR.OPS.070.FC Alternative Training and Qualification Program and AMC.OR.OPS.070.FC Alternative Training and Qualification Program is not feasible Swiss International Air Lines would like the following:

- A defined ATQP structure and process (components, timeline, grandfather rights)
- An ability to extend the validity periods of the OPC, Line Check and Emergency/Safety Checks as per EU-OPS 1.978 Alternative Training and Qualification Program

Swiss International Air Lines do not want to lose the benefits the company has gained by following the EU-OPS ATQP process, and the ability to vary the periods of validity is fundamental to this. Swiss International Airlines is also concerned that the only way to achieve an ATQP under EASA OPS is by an Alternative Means of Compliance.

Swiss International Air Lines is sincerely hoping that EASA will consider this comment thoroughly. Training under ATQP is proven superior to traditional training and Swiss International Air Lines would like to exploit the opportunities in the program further on.

**Appendix A**

**Components of an ATQP Swiss International Airlines**

**All Components are thoroughly developed, refined and approved by Swiss FOCA**

comment by: *Axel Ockelmann + Manfred Poggensee Commercial Balloon Operators Germany*

From our point of view, commercial operations with balloons are not CAT. The sum of the following specifications are not applicable for balloons. EASA has to find lower requirements for:

130-b) not applicable

135.FC b+c) we need no conversion-course.

Balloons are always very similar. Therefore the hot-air-balloon for example is one type on the certificates, although there are different manufacturers.

145.FC b3) operator proficiency-check and emergency and safety equipment check/training shall be every 24-month (including first-aid-training)

145.FC.f) extra Ground training ist not nessecary for flight-crew of balloons

Take all these comments also for Chapter 3 in your mind.

comment by: *ECA - European Cockpit Association*

Comment on OR.OPS.115.FC(b): change as follows:

(a) Inexperienced flight crew members shall not be part of the same flight crew.

(b) The pilot-in-command may delegate the conduct of the flight to another pilot suitably qualified in accordance with Part FCL and fulfilling the

requirements of OR.OPS.020(b).

~~The delegation shall include all the responsibilities of the pilot in command.~~

Justification:

From a legal standpoint, there can only be one pilot in command of the aircraft, passengers, crew members and cargo. This responsibility can not be delegated.

comment 240

comment by: ECA - European Cockpit Association

Comment on OR.OPS.115.FC(b): change as follows:

(b) The pilot-in-command may delegate the conduct of the flight to another pilot suitably qualified in accordance with Part FCL and fulfilling the requirements of ~~OR.OPS.020(b)~~ **OR.OPS.020.FC (b)**.

The delegation shall include all the responsibilities of the pilot in command.

Justification:

OR.OPS.020(b) doesn't exist.

comment 241

comment by: ECA - European Cockpit Association

Comment on OR.OPS.115.FC(c)(2)(i): delete as follows and replace with original wording from Appendix 2 to EU OPS 1.940 (a):

~~(i) The pilot has undertaken training on the operator's procedures, in particular regarding The operator shall include in the Operations Manual a pilot's conversion and recurrent training programme which includes the additional requirements for a single pilot operation; In particular, the cockpit procedures must include:~~

- Engine management and emergency handling;
- Use of normal, abnormal and emergency checklist;
- ATC communication;
- Departure and approach procedures;
- Autopilot management, if applicable; and
- Use of simplified inflight documentation;

Justification:

This restores the requirement for a comprehensive specific single pilot training program.

comment 242

comment by: ECA - European Cockpit Association

Comment on OR.OPS.115.FC(c)(2)(iii): change text as follows:

(iii) For operations under IFR **and at night**:

- - The pilot has a minimum of 50 hours flight time under IFR on the relevant type or class of aeroplane, of which 10 hours as pilot-in-command; and
- - The pilot has completed 5 IFR flights, including 3 instrument approaches, in a single-pilot role, or undertaken an IFR instrument approach check during the preceding 90 days on the relevant type

or class of aeroplane; and

**(iv) For operations at night:**

~~— The pilot has a minimum of 15 hours flight time at night which may be included in the 50 hours flight time under IFR in paragraph (iii) above; and~~

~~— The pilot has completed three takeoffs and landings at night on the type or class of aeroplane in the single pilot role, or undertaken a night takeoff and landing check during the preceding 90 days on the relevant type or class of aeroplane.~~

Justification:

This was the EU OPS requirement. IFR and night flights shall be under the same rule. Moreover, in northern parts of Europe, the night recency requirement will be outrageously burdensome for no safety benefit.

comment

243

comment by: *ECA - European Cockpit Association*

Comment on OR.OPS.115.FC: Reintroduce recent experience required by JAR OPS 1.970 from FCL.060 to this paragraph.

Justification:

The transfer of responsibility for recency from operators to crew members is desirable.

comment by: Dassault Aviation

Technical comment.

Page 14 OR.OPS.115.FC §(c)(1): first reading may be confusing, since one may think that the part of the sentence reading "*with a MPSC of more than 9*" applies as well to all turbojet aeroplanes. To avoid any confusion, we propose to re-word the sentence as follows: "*the minimum flight crew shall be 2 pilots for all turbo-propeller aeroplanes with a maximum passenger seating configuration of more than 9 and all turbojet aeroplanes*".

comment

691

comment by: Dassault Aviation

Technical comment.

Page 14 OR.OPS.115.FC §(c)(1): this paragraph requires 2 pilots minimum as soon as the aircraft is turbojet-equipped and is operated under CAT and IFR or at night. This paragraph should allow provisions as regards to the minimum flight crew if it is demonstrated through the OSC - and provided the Airplane Flight Manual allows it - that another concept of minimum flight crew is acceptable. These IRs AIR OPERATIONS being the future regulations, they should take into account possible future design evolutions, where the minimum flight crew may be re-arranged compared to what is required since decades. We therefore propose to introduce sub-paragraphs (i) and (ii) and reword §(c)(1) as follows:

*(c) Specific requirements for aeroplanes operations under IFR or at night.*

*(1) The minimum flight crew shall be:*

***(i) 2 pilots for all turbo-propeller aeroplanes with a maximum passenger seating configuration of more than 9 and all turbojet aeroplanes, or***

***(ii) Approved through Part 21.***

comment

comment by: Civil Aviation Authority of Norway

In paragraph (c)(2)(iii), last bullet, we find a requirement that 5 IFR flights and 3 instrument approaches or an IFR instrument approach check, no older than 90 days, must be performed "*...on the relevant type or class of aeroplane.*"

In paragraph (d)(2)(iii), last bullet, we find the corresponding requirements for helicopters. However, here we find that the requirements must be performed "*...on the relevant type of helicopter or FSTD.*"

We assume this to be a mistake, that an FSTD can be used for helicopters but not for aeroplanes.

However, adding FSTD to the aeroplane regulation does not solve all:

We also draw your attention to the fact that the definition of FSTD includes BITD. We assume it is not intended to let anyone maintain their proficiency by using such a basic instrument training device. So one should perhaps change "FSTD" in above paragraph to read "FTD or FFS"?

Single pilot CRM has several distinct factors that do not apply to multi crew

operations and, for completeness, CRM could be included.

**Proposed Text (if applicable):** "...Single pilot CRM"

comment by: UK CAA

**Page No:** 15

**Paragraph No:**

OR.OPS.115.FC (d) (2) (ii)

**Comment:**

The exact meaning of the rule is not clear. An environment representative of the operation is too broad a requirement.

**Justification:**

If the term means night/IFR then that should be used.

**Proposed Text (if applicable):**

The recurrent checks required by OR.OPS145.FC are performed in the single pilot role on the particular aircraft type under IFR and/or night as applicable to that operation.

comment 1807

comment by: Karl Wagner

With regard to single pilot operations (OR.OPS.115.FC(c)(i)) I believe that the limit for single pilot operation of turbo propeller aeroplanes should not be referenced to the seating capacity. This results in absurd situations: Take a King Air 350: in standard seating configuration (9) it may be flown single pilot. If you add two optional seats in the baggage compartment, you need two pilots. What would you explain that to a passenger?

If you really want to set such limit it should be performance Category. Category A requires two pilots, performance category B requires only one. On the other hand I firmly believe, that any turbopropeller aeroplane in commercial operation should always be flown by two pilots. Do you really believe a King Air 200 is easier to fly than a Citationjet? I don't.

Any regulation for single pilot must consider training as well. Right now training for a single pilot aircraft must be single pilot (10 hours - Compare that to multi pilot aircraft requiring 32 hours) I think that is madness! You send a youngster for a type rating on a Citationjet and he comes back with a captain's rating after just ten hours (there is no copilot rating because the aircraft is single pilot) - and then he has to fly as part of a multiple crew cockpit. Same on any turboprop. His counterpart on a Citation Bravo requires 32 hours and has a rating as copilot. Why?

My suggestion would be: On Turboprops and Jets Ratings should be trained for dual pilot operation first. Then, after gaining some experience any one who is mad enough for an extra single pilot course.

comment 3378 comment by: *ECA - European Cockpit Association*

Comment on OR.OPS.115.FC (b):

ECA requests clarification:

Does that mean that if the F/O conducts the flight, he is immediately PIC? ECA recommends to use Commander instead of PIC to clarify what is meant.

comment 3385 comment by: *ECA - European Cockpit Association*

Comment on OR.OPS.115.FC (c) 2.: delete (c)(2) and replace with EU OPS 1.944 b)2. wording:

(c) Specific requirements for aeroplane operations under IFR or at night.

(1) The minimum flight crew shall be 2 pilots for all turbojet aeroplanes and all turbopropeller aeroplanes with a maximum passenger seating configuration of more than 9.

~~(2) Aeroplanes other than those covered by (c)(1) may have the minimum flight crew reduced from 2 to 1 pilot provided that:~~

~~(i) The pilot has undertaken training on the operator's procedures, in particular regarding:~~

- ~~– Engine management and emergency handling;~~
- ~~– Use of normal, abnormal and emergency checklist;~~
- ~~– ATC communication;~~
- ~~– Departure and approach procedures;~~
- ~~– Autopilot management, if applicable; and~~
- ~~– Use of simplified inflight documentation;~~

~~(ii) The recurrent checks required by OR.OPS.145.FC are performed in the single pilot role on the relevant type or class of aeroplane in an environment representative of the operation;~~

~~(iii) For operations under IFR:~~

~~– the pilot has a minimum of 50 hours flight time under IFR on the relevant type or class of aeroplane, of which 10 hours as pilot in command; and~~

~~– the pilot has completed 5 IFR flights, including 3 instrument approaches, in a single pilot role, or undertaken an IFR instrument approach check during the preceding 90 days on the relevant type or~~

~~class of aeroplane; and~~  
Minimum flight crew for operations under IFR or at night. For operations under IFR or at night, an operator shall ensure that: (1) for all turbo-propeller aeroplanes with a maximum approved passenger seating configuration of more than nine and for all turbo-jet aeroplanes, the minimum flight crew is two pilots; or (2) aeroplanes other than those covered by subparagraph (b)(1) are operated by a single pilot provided that the requirements of Appendix 2 to OPS 1.940 are satisfied. If the requirements of Appendix 2 are not satisfied, the minimum flight crew is two pilots.

Justification:

The current wording suggests that the "minimum flight" crew may be reduced – which is never the case. The rule should allow single pilot operations under certain circumstances. This text is inappropriate, the EU-OPS text was unambiguous.

comment

**Justification:** Editorial

**Proposed Text (if applicable):**  
 Change text to read "OR.OPS.020.FC(b)".

comment

3427

comment by: *UK CAA*

**Page No:** 14

**Paragraph No:**  
 OR.OPS.115.FC(b)

**Comment:**  
 This IR and the AMC associated with it require that a pilot-in-command (PIC) may only be relieved by a pilot who is either another PIC (AMC OR.OPS.015.FC(d) para 1) or who is a co-pilot who meets the requirements of the AMC **and** has completed a Command Course (AMC OR.OPS.015.FC(d) para 1c).

This is more restrictive than the EU-OPS 1.940 (5) and Appendix 1 to OPS 1.940 (all current cruise relief pilots **do not** require a command course to

perform these functions) and will have a serious financial implications for airlines operating with relief pilots (they will all require command courses) and has no benefit to safety.

**Justification:**

There is no safety reason to deviate from EU-OPS 1.940(5) and Appendix 1 to OPS 1.940

comment

3428

comment by: UK CAA

**Page No:** 14

**Paragraph No:**

OR.OPS.115.FC (c)(2)

**Comment:**

In the opening lines of this paragraph the IR refers to reducing the number of pilots from 2 to 1. This inference is the opposite to that contained in Appendix 2 to OPS 1.940. EU OPS requires that for all those aeroplanes that do not comply with the requirements of OPS 1.940(b)(1) they shall meet the requirements of the Appendix if the operator wishes them to be flown with a single pilot. If the operator's pilots cannot meet the requirements of the Appendix, then for these pilots to operate their single pilot certificated aeroplanes at night, there must be 2 pilots on board, i.e. they *must increase the number of pilots*.

**Justification:**

Safety. Operators will believe that they may reduce the number of pilots to 1 when they should be increasing the number to 2.

**Proposed Text (if applic able):** Amend the text to read, "*Aeroplanes other than those covered in (c)(1) above may be operated by a single pilot provided the requirements below are met. If the requirements cannot be met, the minimum flight crew shall be 2 pilots.*"

(b)

OR.OPS.020.FC Designation as pilot-in-command (b)(3), OR.OPS.115.FC Composition of Flight Crew (b) and OR.OPS.120.FC Command course are interlinked but have a significant effect when related to Augmented Crew Operation. EASA have chosen not to use the term 'Commander' which was utilised by the JAA to differentiate between pilots who were licensed to be in command but were not nominated as pilot-in-command. EASA reasoning is that ICAO do not use the term. However in the JAA/EU-OPS/EASA world there is an anomaly in that in some states a pilot is rated in his license automatically as Pilot-in-command [or co-pilot] UK.EIRE being 2 but there are others. The remaining States rate a Pilot as Co-Pilot OR pilot-in-command. Thus in these states [UK,EIRE etc] a Cruise relief Captain [co-pilot with pilot-in-command privileges] need only have such training as decided by the Operator. Those other States have to give a co-pilot a LHS OPC [as it stands at this time]. This procedure is adopted in Germany/France and other states.

The consequence of EASA's planning is to require a relief Captain to be a Captain and no longer a Co-Pilot with pilot-in-command privileges and appropriate training as decided by the operator.

EASA indicates that the relieving Pilot has total command of the aircraft, which is not true as the 'Commander' is still legally responsible for the flight. In a 2 man crew, when the Captain goes to the toilet, the F/O becomes the Pilot flying, but the Captain [Commander] is still legally responsible. The AMC should clarify that there is only one pilot-in-command, who retains the final decision during the entire flight, even when relieved by another pilot [e.g. cruise relief captain] for the conduct of the flight. [Excepting the formal hand-over in flight of command authority from one "commander" to another in ultra long range operations where two flight crews are required to enable the aircraft to remain airborne beyond what hitherto has been agreed as an acceptable flight duty period. The off-duty crew can therefore obtain uninterrupted and recuperative rest.] The pilot-in command status is not related to pilot-flying/pilot-not-flying, but identifies the flight crew member as being the "final authority" on board.

The outcome of this is that there will be increased crew costs but without any proven increase in Safety. If the current system is unsafe then it should be stopped immediately not wait until EASA regulations become law.

Proposal:

1. Use EU-OPS Appendix 1 to EU-OPS 1.940
2. Reinstate the term 'Commander' as per EU-OPS 1.940 (a) 5 to avoid confusion

(b)

This rule is incorrect: not all legal responsibilities of the PIC can be delegated.

Delegation is limited to conduct-of-flight-duties.  
 The rule shall confirm that there is only one pilot-in-command, who retains the final decision during the entire flight, even while relieved by another pilot (e.g. cruise relief captain) for the conduct of the flight.  
 The pilot-in-command status is not related to pilot-flying/pilot-non-flying, but identifies the flight crew member as being the "final authority" on board.

comment 4068

comment by: *British Airways***Relevant Text:**

(b) The pilot-in-command may delegate the conduct of the flight to another suitably qualified in accordance with Part-FCL and fulfilling the requirements of OR.OPS.020(b). The delegation shall include all the responsibilities of the pilot-in-command

**Comment:**

This paragraph is not in line with Appendix 1 to EU-OPS 1.940 which does not require a Command Course/Commander for the In-Flight Relief of the Pilot-in-Command (see previous comments).

In addition, the delegation is limited to the conduct of the flight but should not include all the responsibilities of the Commander

**Proposal:**

Realign with EU-OPS

 OR.OPS.020.FC Designation as pilot-in-command (b)(3), OR.OPS.115.FC Composition of Flight Crew (b) and OR.OPS.120.FC Command course are interlinked but have a significant effect when related to Augmented Crew Operation. EASA have chosen not to use the term 'Commander' which was utilised by the JAA to differentiate between pilots who were licensed to be in command but were not nominated as pilot-in-command. EASA reasoning is that ICAO do not use the term. However in the JAA/EU-OPS/EASA world there is an anomaly in that in some states a pilot is rated in his license automatically as Pilot-in-command [or co-pilot] UK,EIRE being 2 but there are others. The remaining States rate a Pilot as Co-Pilot OR pilot-in-command. Thus in these states [UK,EIRE etc] a Cruise relief Captain [co-pilot with pilot-in-command privileges] need only have such training as decided by the Operator. Those other States have to give a co-pilot a LHS OPC [as it stands at this time]. This procedure is adopted in Germany/France and other states.  
 The consequence of EASA's planning is to require a relief Captain to be a

Captain and no longer a Co-Pilot with pilot-in-command privileges and appropriate training as decided by the operator.

EASA indicates that the relieving Pilot has total command of the aircraft, which is not true as the 'Commander' is still legally responsible for the flight. In a 2 man crew, when the Captain goes to the toilet, the F/O becomes the Pilot flying, but the Captain [Commander] is still legally responsible. The AMC should clarify that there is only one pilot-in-command, who retains the final decision during the entire flight, even when relieved by another pilot [e.g. cruise relief captain] for the conduct of the flight. The requirement of minimum 10 sectors of LIFUS does not take into account Operators exchanging flight crew and that has implemented common SOP and training. There must be a possibility to reduce the numbers of sectors taking into account the level of similarity for Operators utilizing common SOP. In some cases the LIFUS may be reduced to zero.

Comment regarding:

(a) Except in the case of balloons:

(1) A flight crew member shall have completed an initial CRM training course before commencing unsupervised line flying.

Suggestion:

Add..within their first year of joining an operator.

Reason: This gives operators more flexibility.

comment

854

comment by: *ECA - European Cockpit Association*

Comment on OR.OPS.130.FC (a) (1): Change text:

(a) Except in the case of balloons:

(1) A flight crew member shall have completed an initial CRM training course **within one year after** ~~before~~ commencing unsupervised line flying.

Justification:

New crew members build on their knowledge on HPL theory. Within their first year they adapt that knowledge to actual operational practices. With this experience they should be subject to a CRM training. Without operational experience, CRM training, being the combination of theory and operation, has little effect.

comment

855

comment by: *ECA - European Cockpit Association*

Comment on OR.OPS.130.FC (b): change text:

(b) If the flight crew member has not previously received theoretical training in Human Factors to the ATPL level, he/she shall complete, ~~before, or combined with, the initial CRM training,~~ a theoretical course provided by the operator and based on the human performance and limitations syllabus for the ATPL as established in Part FCL **before commencing line training.**

Justification:

Theoretical knowledge is required before commencing line training. Knowledge acquisition is different from the methods used in CRM training. Therefore a combination of HPL theory instruction and CRM training is not effective.

OR.OPS.135.FC Operator conversion training and checking**

p. 16

comment

146

comment by: *EHO*

Paragraph (a)(1)

This rule and the associated GM is reliant upon a nuance of the word 'during'; will it be clear to operators that if a conversion course is not completed and the pilot reverts to another type, the course has been terminated and the pilot is no longer within (or in the terminology of the rule - 'during') a conversion course?

The text might be amended so that the intent is clear - a suggested text is:

"(2) once an operator's conversion course has commenced, the flight crew member shall not undertake flying duties on another type or class until the course has been completed or terminated."

comment 862 comment by: ECA - European Cockpit Association

Comment on OR.OPS.135.FC (a) (2): change text:

~~(2) during the operator conversion course the flight crew member shall not undertake flying duties on another type or class of aircraft.~~

**(2) Once a type rating course and the operator conversion course has been commenced, the operator shall not assign the flight crew member to flying duties on another type or class of aircraft until the courses are completed or terminated.**

Justification:

See comment 861 to OR.OPS.035.FC. The crew member is only protected from flying duties during the conversion course, and not during the type rating course. This is not acceptable with the a.m. reasoning. Text from EU-OPS was clearer in a way that this requirement starts at the beginning of a conversion course and is valid to its end.

comment 864 comment by: ECA - European Cockpit Association

Comment on OR.OPS.135.FC (b): Delete paragraph and replace with original wording from EU-OPS 1.945 (a) (5) as follows:

~~(b) The amount of training required by the flight crew member for the operator's conversion course shall be determined in accordance with the standards of qualification and experience specified in the Operations Manual, taking into account his/her previous training and experience. The minimum standards of qualification and experience required of flight crew members before undertaking conversion training are specified in the operations manual.~~

Justification:

EU-OPS required minimum experience standards (before a crew member could start conversion training) to be specified in the OM-A. The new text is ambiguous as to whether this still applies. The text can be interpreted that these minimum standards need not be established, but only general training standards are sufficient.

comment 870 comment by: ECA - European Cockpit Association

Comment on OR.OPS.135.FC (d): add a new (2) and renumber present (2) to (3):

**(2) Complete the six take-offs and landings in a flight simulator, qualified in accordance with (EASA IR) and user approved by the Authority, not later than 21 days after the completion of the skill test. This simulator session shall be conducted by a TRI(A) occupying a pilot's seat.**

Justification:

ZFTT must include six TO and LDGs in an FSTD. Add qualification of FSTD acc to new EASA IRs.

(d)(2) conduct the first 4 take offs and landings of the line flying under supervision in the aeroplane under the supervision of a TRI(A) occupying the other pilot seat, unless otherwise specified in accordance with Part-21

**Comment:**

The reference to Part-21 should be amended to to refer to credits from the (Operational Suitability Certificate. This should not be understood as AEA support for the current O-SC concept and processes (see AEA comments to NPA 2009-1) but as a desire from the AEA/operators to get credits from current JOEB processes.

Whether or not the TRI(A) should occupy the other pilot seat should not be part of implementing rules (hard-law) but could be part of guidance material to allow different approaches.

**Proposal:**

Delete ' occupying the other pilot seat and amend, 'unless otherwise specified in accordance with Part-21" to read as '*unless credits are established in the Operational Suitability Certificate established in accordance with Part-21*

comment 3141 comment by: *DGAC*

The following rule about 6 take offs and landings for ZFTT was previously :

in Appendix 1 to JAR FCL 1.261 (c) (2) § 2 (c)

*“Unless specified otherwise, a specific simulator session including a minimum of six additional take-offs and landings included in the type rating course shall be conducted according to JAR-OPS 1.945(d)(2).”*

- in JAR-OPS 1.945 (d)(2):

*“(d) A pilot, undertaking a ZFTT course, shall:*

*(2) Complete the six take-offs and landings required in Appendix 1 JAR-FCL 1.261(c)(2) in a flight simulator, qualified in accordance with JAR-STD and user approved by the Authority, not later than 21 days after the completion of the skill test.*

*This simulator session shall be conducted by a TRI(A) occupying a pilot's seat.*

*When recommended by a Joint Operational Evaluation Board (JOEB) and approved by the Authority, the number of take-offs and landings may be reduced.*

*If these take-offs and landings have not been performed within the 21 days, the operator shall provide refresher training acceptable to the Authority”*

We cannot find that rule in any of the drafted NPA (NPA 17c, 22 AR, 22 OR, or 2009 -02)

**Proposal:** Therefore the following text should be added at the end of (d) of OR.OPS.135.FC, after (d)(2) :

“(d) Aeroplanes. Pilots that have been issued a type rating based on a zero flight time training (ZFTT) course shall:

(1) [...]

(2) [...]

**(3) Complete six take-offs and landings in a FSTD, and user approved, not later than 21 days after the completion of the skill test, and before line flying under supervision.**

**This simulator session shall be conducted by a TRI(A) occupying a pilot's seat.**

**The number of take-offs and landings may be reduced, in accordance with part-21”**

**C. III. Draft Opinion Part-OR - Subpart OPS - Section V - Chapter 2 -  
OR.OPS.145.FC Recurrent training and checking**

p. 17

comment 7 comment by: *David COURT*

Every 6 months is too frequent for balloons. In many countries there is little flying in the winter leaving a season of about 8 months. I would prefer the prof check every 12 months and include a Line Check. I do not understand why balloons are excluded from the Line Check.

comment 8 comment by: *David COURT*

There are no Type Rating Examiners listed in NPA 2008 17b. TRE(B) will be needed to conduct the proficiency checks.

Typing error referencing to text under OR.OPS.145 FC (g)

--> reference (b)(3) instead of (d)(3)

--> reference (c) instead of (e)

--> reference (d) instead of (f)

**Text to be added:**

The references under the above mentioned paragraph should be ... (g) The validity periods mentioned in **(b)**(3), **(c)** and **(d)** shall be counted ... rest of text no change.

**Proof:**

Self explanatory.

**Background:**

Swiss Air Ambulance is a subsidiary of Rega, Switzerland's national air-rescue organisation, which was founded in 1952. Swiss Air Ambulance can draw on decades of experience and the expertise of professional teams to provide competent, comprehensive assistance in the event of medical emergencies all over the world operating besides 13 dedicated HEMS helicopters 3 dedicated Bombardier CL-604 "Challenger" ambulance jets with a range of 3'500 NM. Its services range from providing medical advice to repatriating patients to/from Switzerland or any other point of the world. Swiss air-ambulance is a private, non-profit organisation, which operates in accordance with the guiding principles of the Red Cross. It comes to the aid of people in distress, without respect of their nationality, religious conceptions or social status. Swiss air-ambulance operates under the Air Operator Certificate CH-AOC-No.1015 issued by the Federal Office of Civil Aviation Switzerland (FOCA) and is compliant with EU-OPS. comment 651 comment by: *Bristow Helicopters*

**OR.OPS.145.FC(f)**

**Comment** - The interpretation of "aircraft/FSTD training" is not clear. Does this mean that training may take place on **either** aircraft **or** FSTD, or **both** aircraft **and** FSTD must be used.

**Justification** - This needs to be clear if the intention is to promote the use of FSTD within commercial operators training programmes. However, the rule must also accommodate the limited availability of suitable FSTD's for helicopters, and in some cases there may be no FSTD at all, especially during the initial period of operation of a new type or variant.

**Proposed Amendment** - Include text in AMC1 OR.OPS.145.FC to promote the use of FSTD where these are available. Such text is already contained in Appendix 1 to JAR-OPS 3.965(2)(ii), although this is specific to engine malfunctions only, but should be extended to all of the aircraft systems.

**AMC1 OR.OPS.145.FC Insert new paragraph:**

**1.4.5 Where a suitable FSTD is available it should be used for the aircraft/FSTD training programme, unless discounted by risk assessment taking into account the complexity of the aircraft.**

(1) Elements of CRM shall be integrated into all appropriate phases of the recurrent training. **The operator shall ensure that all personnel conducting recurrent training are suitably qualified to integrate elements of CRM into this training.**

Justification:

The credibility of a CRM trainer depends on his/her qualification, so all personnel conducting training need to be familiar with CRM concepts.

comment 880

comment by: *ECA - European Cockpit Association*

Comment on OR.OPS.145.FC (e) (2): add text:

(2) Each flight crew member shall undergo specific modular CRM training. All major topics of CRM training shall be covered over a period not exceeding 3 years. **Modular CRM training shall be conducted by at least one suitably qualified CRM trainer who may be assisted by experts in order to address specific areas.**

Justification:

The credibility of a CRM trainer depends on his/her qualification; the trainer qualification requirements for modular training should be the same as for initial CRM training.

New Proposal

**Comment:**

OR.OPS.145.FC adequately addresses the requirements of EU-OPS 1.965 but there is no specific recognition of the enhanced OPC, Line Check and SEP validity periods as currently prescribed in EU-OPS 1.978.

The alternative schedule for checking provided in EU-OPS 1.978 is integral to the benefits of allowing Operators to provide valuable additional Operator Specific Training. The removal of this specific recognition appears to be an unintentional omission on EASA's part and seemingly with no safety justification.

We cannot believe that it is the intention of EASA to discontinue the current ATQP arrangements for Operators who already have sought and gained approval for an ATQP programme having already demonstrated that they meet the requirements of EU-OPS 1.978 and the associated AMC.

**Proposal:**

Include the following (new) regulation:

**OR.OPS.150.FC - Alternative training and qualification programme**

(a) An operator, following a minimum of two years continuous operations, may substitute the training and checking requirements for flight crew specified in Appendix 1 to OPS 1.978(a) by an alternative training and Qualification programme (ATQP) approved by the Authority. The two years continuous operations may be reduced at the discretion of the Authority.

(b) The ATQP must contain training and checking which establishes and maintains a level of proficiency demonstrated to be at least not less than the level of proficiency achieved by following the provisions of OPS 1.945, 1.965 and 1.970.

The standard of flight crew training and qualification shall be established prior to the introduction of ATQP; the required ATQP training and qualification standards shall also be specified.

(c) An operator applying for approval to implement an ATQP shall provide the Authority with an implementation plan in accordance with paragraph (c) of Appendix 1 to OPS 1.978.

(d) In addition to the checks required by OPS 1.965 and 1.970 an operator shall ensure that each flight crew member undergoes a Line Orientated Evaluation (LOE).

1. The line orientated evaluation (LOE) shall be conducted in a simulator. The LOE may be undertaken with other approved ATQP training.

2. The period of validity of a LOE shall be 12 calendar months, in addition to the remainder of the month of issue.

If issued within the final three calendar months of validity of a previous LOE the period of validity shall extend from the date of issue until 12 calendar months from the expiry date of that previous LOE.

(e) After two years of operating within an approved ATQP an operator may, with the approval of the Authority, extend the periods of validity of OPS 1.965 and 1.970 as follows:

1. operator proficiency check — 12 calendar months in addition to the remainder of the month of issue. If issued within the final three calendar months of validity of a previous operator proficiency check, the period of validity shall extend from the date of issue until 12 calendar months from the expiry date of that previous operator proficiency check;

2. line check — 24 calendar months in addition to the remainder of the month of issue. If issued within the final six calendar months of validity of a previous line check, the period of validity shall extend from the date of issue until 24 calendar months from the expiry date of that previous line check. The line check may be combined with a line oriented quality evaluation (LOQE) with the approval of the authority;

3. emergency and safety equipment checking — 24 calendar months in addition to the remainder of the month of issue. If issued within the final 6 calendar months of validity of a previous check, the period of validity shall extend from the date of issue until 24 calendar months from the expiry date of that previous check.

(f) The ATQP shall be the responsibility of a nominated post holder.

With reference to OR.OPS.145.FC part b Operator Proficiency Check (3) 'period of validity.....6 months'..... in the case of balloons this is excessive and also costly to maintain bearing in mind that the effective flyind season is only six months long. Surely an annual Line Check an valid medical would be sufficient to remain proficient for each year.

New Proposal

**Comment:**

OR.OPS.145.FC adequately addresses the requirements of EU-OPS 1.965 but there is no specific recognition of the enhanced OPC, Line Check and SEP validity periods as currently prescribed in EU-OPS 1.978.

The alternative schedule for checking provided in EU-OPS 1.978 is integral to the benefits of allowing Operators to provide valuable additional Operator Specific Training. The removal of this specific recognition appears to be an unintentional omission on EASA's part and seemingly with no safety justification.

We cannot believe that it is the intention of EASA to discontinue the current ATQP arrangements for Operators who already have sought and gained approval for an ATQP programme having already demonstrated that they meet the requirements of EU-OPS 1.978 and the associated AMC.

**Proposal:**

Include the following (new) regulation:

**OR.OPS.150.FC - Alternative training and qualification programme**

*(a) An operator, following a minimum of two years continuous operations, may substitute the training and checking*

requirements for flight crew specified in Appendix 1 to OPS 1.978(a) by an alternative training and qualification programme (ATQP) approved by the Authority. The two years continuous operations may be reduced at the discretion of the Authority.

(b) The ATQP must contain training and checking which establishes and maintains a level of proficiency demonstrated to be at least not less than the level of proficiency achieved by following the provisions of OPS 1.945, 1.965 and 1.970.

The standard of flight crew training and qualification shall be established prior to the introduction of ATQP; the required ATQP training and qualification standards shall also be specified.

(c) An operator applying for approval to implement an ATQP shall provide the Authority with an implementation plan in accordance with paragraph (c) of Appendix 1 to OPS 1.978.

(d) In addition to the checks required by OPS 1.965 and 1.970 an operator shall ensure that each flight crew member undergoes a Line Orientated Evaluation (LOE).

1. The line orientated evaluation (LOE) shall be conducted in a simulator. The LOE may be undertaken with other approved ATQP training.

2. The period of validity of a LOE shall be 12 calendar months, in addition to the remainder of the month of issue.

If issued within the final three calendar months of validity of a previous LOE the period of validity shall extend from the date of issue until 12 calendar months from the expiry date of that previous LOE.

(e) After two years of operating within an approved ATQP an operator may, with the approval of the Authority, extend the periods of validity of OPS 1.965 and 1.970 as follows:

1. operator proficiency check — 12 calendar months in addition to the remainder of the month of issue. If issued within the final three calendar months of validity of a previous operator proficiency check, the period of validity shall extend from the date of issue until 12 calendar months from the expiry date of that previous operator proficiency check;

2. line check — 24 calendar months in addition to the remainder of the month of issue. If issued within the final six calendar months of validity of a previous line check, the period of validity shall extend from the date of issue until 24 calendar months from the expiry date of that previous line check. The line check may be combined with a line oriented quality evaluation (LOQE) with the approval of the authority;

3. emergency and safety equipment checking — 24 calendar months in addition to the remainder of the month of issue. If issued within the final 6 calendar months of validity of a previous check, the period of validity shall extend from the date of issue until 24 calendar months from the expiry date of that previous check.

(f) The ATQP shall be the responsibility of a nominated post holder.

comment by: Ted Moore

The Classification of balloon flights as commercial air transport is unreasonable and not in line with ICAO rules which only require the classification for international flights. This is certainly not the case for passenger rides in balloons.

If the classification CAT cannot be changed then the rules for proficiency checks are excessive for commercial balloon pilots.

An annual type rating examination is perfectly adequate especially in northern

hemisphere countries where the flying season is limited to the six summer months.

**Relevant Text:**

New regulation proposed

**Comment:**

OR.OPS.145.FC adequately addresses the requirements of EU-OPS 1.965 but there is no specific recognition of the enhanced OPC, Line Check and SEP validity periods as currently prescribed in EU-OPS 1.978.

The alternative schedule for checking provided in EU-OPS 1.978 is integral to the benefits of allowing Operators to provide valuable additional Operator Specific Training. The removal of this specific recognition appears to be an unintentional omission on EASA's part and seemingly with no safety justification.

We cannot believe that it is the intention of EASA to discontinue the current ATQP arrangements for Operators who already have sought and gained approval for an ATQP programme having already demonstrated that they meet the requirements of EU-OPS 1.978 and the associated AMC.

**Proposal:**

Include the following (new) regulation:

OR.OPS.150.FC - Alternative training and qualification programme

(a) An operator, following a minimum of two years continuous operations, may substitute the training and checking requirements for flight crew specified in Appendix 1 to OPS 1.978(a) by an alternative training and Qualification programme (ATQP) approved by the Authority. The two years continuous operations may be reduced at the discretion of the Authority.

(b) The ATQP must contain training and checking which establishes and maintains a level of proficiency demonstrated to be at least not less than the level of proficiency achieved by following the provisions of OPS 1.945, 1.965 and 1.970. The standard of flight crew training and qualification shall be established prior to the introduction of ATQP; the required ATQP training and qualification standards shall also be specified.

(c) An operator applying for approval to implement an ATQP shall provide the Authority with an implementation plan in accordance with paragraph (c) of Appendix 1 to OPS 1.978.

(d) In addition to the checks required by OPS 1.965 and 1.970 an operator shall ensure that each flight crew member undergoes a

Line Orientated Evaluation (LOE).

1. The line orientated evaluation (LOE) shall be conducted in a simulator. The LOE may be undertaken with other approved ATQP training.

2. The period of validity of a LOE shall be 12 calendar months, in addition to the remainder of the month of issue. If issued within the final three calendar months of validity of a previous LOE the period of validity shall extend from the date of issue until 12 calendar months from the expiry date of that previous LOE.

(e) After two years of operating within an approved ATQP an operator may,

with the approval of the Authority, extend the periods of validity of OPS 1.965 and 1.970 as follows:

1. operator proficiency check — 12 calendar months in addition to the remainder of the month of issue. If issued within the final three calendar months of validity of a previous operator proficiency check, the period of validity shall extend from the date of issue until 12 calendar months from the expiry date of that previous operator proficiency check;

2. line check — 24 calendar months in addition to the remainder of the month of issue. If issued within the final six calendar months of validity of a previous line check, the period of validity shall extend from the date of issue until 24 calendar months from the expiry date of that previous line check. The line check may be combined with a line oriented quality evaluation (LOQE) with the approval of the authority;

3. emergency and safety equipment checking — 24 calendar months in addition to the remainder of the month of issue. If issued within the final 6 calendar months of validity of a previous check, the period of validity shall extend from the date of issue until 24 calendar months from the expiry date of that previous check.

(f) The ATQP shall be the responsibility of a nominated post holder.

**European Regions Airline Association Comment**

Sub-paragraph g) referenced validity points need to be checked as currently

they do not exist. The periods mentioned in sub-paragraph g) and h) differ (one counts from the last day of the month, the other from the expiry date).

Validity periods should be standardised so administration tasks are made easier.

**Paragraph (b) Operator Proficiency check**

For pilots qualified on simple aircraft (single-engined helicopters) the number and type of checks could be rationalised with perhaps one check to cover several helicopter types. Pilots often fly on several types and it is a heavy burden to have one OPC on each type every 6 months.

**Proposed Text**

Add a (4) at the end of paragraph (b) as follows :

“Notwithstanding (a), completion by a flight crew member of operator proficiency check on any single piston engine helicopter as listed in AMC 1 to OR.OPS.145.FC or on any single engine turbine helicopter with a MTOM < 3175 kg, is deemed valid as proficiency check on the other type or variant of single-engined helicopters flown by that flight crew member, provided:

- (i) the Type Rating Proficiency Check (TRPC) on the type being valid; and
- (ii) the achievement of 2 flying hours on the type or variant within the last 6 months; and
- (iv) a strict rotation of OPCs for all helicopters being flown in the designated group

In addition, add a new AMC in AMC&GM to Part OR :

“AMC 1 to OR.OPS.145.FC

The following helicopters may be used for the purpose of operator proficiency check obtained in accordance with OR.OPS.145.FC :

-Bell 47, Brantley B2, HU 269, ENF28, UH12, HU269.”

**Comment to EASA NPA 2009-02c****Author:** easyJet**Page:** 17 of 136**Section:** OR.OPS.145.FC Recurrent training and checking**Relevant Text:** New regulation proposed.**Comment:**

OR.OPS.145.FC does not provide a mechanism for extending OPC, Line Check and SEP validity periods under an Alternative Training and Qualification programme (ATQP) as currently prescribed in EU-OPS 1.978.

The alternative schedule for checking provided in EU-OPS 1.978 is integral to the safety benefits of allowing Operators to provide valuable additional operator specific training under an ATQP. The removal of this mechanism appears to be an unintentional omission on EASA's part and seemingly with no safety justification.

We cannot believe that it is the intention of EASA to discontinue the current ATQP arrangements for Operators who already have sought and gained approval for an ATQP programme having already demonstrated that they meet the requirements of EU-OPS 1.978.

**Proposal:**

Include the following (new) regulation based on EU-OPS 1.978, and (new) AMC based on Appendix 1 to EU-OPS 1.978.

**OR.OPS.150.FC - Alternative training and qualification programme**

(a) An operator, following a minimum of two years continuous operations, may substitute the training and checking requirements for flight crew specified in OR.OPS.145.FC by an Alternative Training and Qualification Programme (ATQP) approved by the Authority. The two years continuous operations may be reduced at the discretion of the Authority.

(b) The ATQP must contain training and checking which establishes and maintains a level of proficiency demonstrated to be at least not less than the level of proficiency achieved by following the provisions of OR.OPS. The standard of flight crew training and qualification shall be established prior to the introduction of ATQP; the required ATQP training and qualification standards shall also be specified.

(c) An operator applying for approval to implement an ATQP shall provide the Authority with an implementation plan.

(d) In addition to the checks required OR.OPS an operator shall ensure that each flight crew member undergoes a Line Orientated Evaluation (LOE).

1. The line orientated evaluation (LOE) shall be conducted in a simulator. The LOE may be undertaken with other approved ATQP training.

2. The period of validity of a LOE shall be 12 calendar months, in addition to the remainder of the month of issue. If issued within the final three calendar months of validity of a previous LOE the period of validity shall extend from the date of issue until 12 calendar months from the expiry date of that previous LOE.

(e) After two years of operating within an approved ATQP an operator may,

with the approval of the Authority, extend the periods of OR.OPS.145.FC follows:

1. Operator Proficiency Check — 12 calendar months in addition to the remainder of the month of issue. If issued within the final three calendar months of validity of a previous operator proficiency check, the period of validity shall extend from the date of issue until 12 calendar months from the expiry date of that previous operator proficiency check;
2. Line Check — 24 calendar months in addition to the remainder of the month of issue. If issued within the final six calendar months of validity of a previous line check, the period of validity shall extend from the date of issue until 24 calendar months from the expiry date of that previous line check. The line check may be combined with a line oriented quality evaluation (LOQE) with the approval of the authority;
3. Emergency and Safety Equipment checking — 24 calendar months in addition to the remainder of the month of issue. If issued within the final 6 calendar months of validity of a previous check, the period of validity shall extend from the date of issue until 24 calendar months from the expiry date of that previous check.

(f) The ATQP shall be the responsibility of a nominated post holder.

#### **AMC O R.OPS.150.FC - Alternative training and qualification programme**

(a) An operator's ATQP may apply to the following requirements that relate to training and qualifications:

1. Low Visibility Operations –Training and Qualifications.
2. Conversion training and checking.
3. Differences training and familiarisation training.
4. Nomination as commander.
5. Recurrent training and checking.
6. Operation on more than one type or variant.

(b) Components of the ATQP — an alternative training and qualification programme shall comprise the following:

1. Documentation that details the scope and requirements of the programme;
2. A task analysis to determine the tasks to be analysed in terms of:
  - (i) knowledge;
  - (ii) the required skills;
  - (iii) the associated skill based training;
 and, where appropriate
  - (iv) the validated behavioural markers.
3. Curricula — the curriculum structure and content shall be determined by task analysis, and shall include proficiency objectives including when and how those objectives shall be met. The process for curriculum development shall be acceptable to the Authority;
4. A specific training programme for:
  - (i) each aeroplane type/class within the ATQP;
  - (ii) the instructors (Class rating instructor rating/Synthetic flight instructor authorisation/Type rating instructor rating — CRI/SFI/TRI), and other personnel undertaking flight crew instruction;
  - (iii) the examiners (Class rating examiner/Synthetic flight examiner/Type rating examiner — CRE/SFE/TRE); to include a method for the standardisation of the instructors and examiners;
5. A feedback loop for the purpose of curriculum validation and refinement, and to ascertain that the programme meets its proficiency objectives;

6. A method for the assessment of flight crew both during conversion and recurrent training and checking. The assessment process shall include event-based assessment as part of the LOE. The method of assessment shall comply with the provisions of OR OPS;
7. An integrated system of quality control, that ensures compliance with all the requirements processes and procedures of the programme;
8. A process that describes the method to be used if the monitoring and evaluation programmes do not ensure compliance with the established proficiency and qualification standards for flight crew;
9. A data monitoring/analysis programme.

(c) Implementation

The operator shall develop an evaluation and implementation strategy acceptable to the Authority;

the following requirements shall be fulfilled:

1. The implementation process shall include the following stages:

(i) a safety case that substantiates the validity of:

(A) the revised training and qualification standards when compared with the standards achieved under OR.OPS prior to the introduction of ATQP.

(B) any new training methods implemented as part of ATQP.

If approved by the Authority the operator may establish an equivalent method other than a formal safety case.

(ii) Undertake a task analysis as required by paragraph (b)2 above in order to establish the operator's programme of targeted training and the associated training objectives.

(iii) A period of operation whilst data is collected and analysed to ensure the efficacy of the safety case or equivalent and validate the task analysis. During this period the operator shall continue to operate to the pre-ATQP OR.OPS requirements. The length of this period shall be agreed with the authority;

2. The operator may then be approved to conduct training and qualification as specified under the ATQP.

**Page No:** 17

**Paragraph No:**

OR.OPS.145.FC (b)(1)

**Comment:**

In the last line, the expression is used "...as part of a normal flight crew complement." This causes problems for those operators who employ more co-pilots than pilots-in-command and so during operator proficiency checks, occasionally 2 co-pilots are put into the simulator together for the conduct of their OPC. This offers nothing to the co-pilot who is not sitting in the correct seat and his OPC.

Inclusion of the words "*for take-off and landing*" after "crew complement" would remove this problem.

**Justification:**

Correct crew membership during OPCs leading to better trained crews.

**Proposed Text (if applicable):**

Insert after "...as part of a normal flight crew complement" the words "...during take-off and landing."

OR.OPS.145.FC(b)&amp;(c)

**Comment:**

Ballooning is seasonal throughout many EC Member States. Therefore, requiring a proficiency check every 6 months is not reasonable. A 12 month interval is preferred and there should also be a Line Check requirement.

**Justification:**

Most balloon operators in Europe will have difficulty in complying with conducting proficiency checks every 6 months.

**Proposed Text (if applicable):**

(b)(3) **Except in the case of balloons**, the period of validity of the operator proficiency check shall be 6 calendar months.

**(4) For balloons, the period of validity of the operator proficiency check shall be 12 calendar months.**

(c) Line check. ~~Except in the case of balloons~~, Each flight crew member shall complete a line check to demonstrate his/her competence in carrying out normal line operations described in the Operations Manual. The period of validity of a line check shall be 12 calendar months.

comment by: UK CAA

**Page No:** 17**Paragraph No:**

OR.OPS.145.FC(e)(2)

**Comment:**

The use of the expression "over a period not exceeding 3 years" is open to misunderstanding. Some operators conduct their specific CRM training once every 3 years and thus comply with this requirement. However, this means that some pilots are only getting refresher CRM training every third year. That is not what was intended by this OPS requirement when it was written originally.

In order to require operators to conduct this training regularly, the wording should be changed.

**Justification:**

To remove the ability of operators to misapply this requirement.

**Proposed Text (if applicable):** Amend to read "...shall be covered throughout a rolling three year period."

comment by: Graham HALLETT

OR.OPS.145.FC

A six month validity for a proficiency check is entirely inappropriate for balloons. What must be borne in mind is the seasonal nature of most ballooning activities, certainly in large portions of Europe. Taking the UK as an example, if a 6 monthly check were required, virtually everybody would get one done at the beginning of the season, in Spring. They would then fly as much as possible throughout summer, then require another check in the Autumn. Having been flying all summer, they would undoubtedly pass this check with ease, but then do very little flying over the Winter months, but then need another check in the Spring again. This second check at the end of the main flying season would thus be rendered pointless. Moreover, because all pilots would require such checks at about the same time, there would simply not be enough examiners available to perform such checks. Trying to carry out any such checks during the Winter months will also prove extremely difficulty in much of Northern Europe, because of the prevailing weather factors. Any such checks for balloons must therefore be annual.

The existing UK system of an annual line and proficiency check undertaken by a type rating examiner has been shown to work well and should be adopted.

comment by: *ANE (Air Nostrum) OPS QM*

Sub-paragraph g) referenced validity points need to be checked as currently they do not exist. The periods mentioned in sub-paragraph g) and h) differ (one counts from the last day of the month, the other from the expiry date).

Validity periods should be standardised so administration tasks are made easier.

comment by: *British Airways*

**Relevant Text:** New regulation proposed.

**Comment:**

OR.OPS.145.FC does not provide a mechanism for extending OPC, Line Check and SEP validity periods under an Alternative Training and Qualification programme (ATQP) as currently prescribed in EU-OPS 1.978.

The alternative schedule for checking provided in EU-OPS 1.978 is integral to the safety benefits of allowing Operators to provide valuable additional operator specific training under an ATQP. The removal of this mechanism appears to be an unintentional omission on EASA's part and seemingly with no safety justification.

We cannot believe that it is the intention of EASA to discontinue the current ATQP arrangements for Operators who already have sought and gained approval for an ATQP programme having already demonstrated that they meet the requirements of EU-OPS 1.978.

**Proposal:**

Include the following (new) regulation based on EU-OPS 1.978, and (new) AMC based on Appendix 1 to EU-OPS 1.978.

**OR.OPS.150.FC - Alternative training and qualification programme**

(a) An operator, following a minimum of two years continuous operations, may substitute the training and checking requirements for flight crew specified in OR.OPS.145.FC by an Alternative Training and Qualification Programme (ATQP) approved by the Authority. The two years continuous operations may be reduced at the discretion of the Authority.

(b) The ATQP must contain training and checking which establishes and maintains a level of proficiency demonstrated to be at least not less than the level of proficiency achieved by following the provisions of OR.OPS. The standard of flight crew training and qualification shall be established prior to the introduction of ATQP; the required ATQP training and qualification standards shall also be specified.

(c) An operator applying for approval to implement an ATQP shall provide the Authority with an implementation plan.

(d) In addition to the checks required OR.OPS an operator shall ensure that each flight crew member undergoes a Line Orientated Evaluation (LOE).

1. The line orientated evaluation (LOE) shall be conducted in a simulator. The LOE may be undertaken with other approved ATQP training.

2. The period of validity of a LOE shall be 12 calendar months, in addition to the remainder of the month of issue. If issued within the final three calendar months of validity of a previous LOE the period of validity shall extend from the date of issue until 12 calendar months from the expiry date of that previous LOE.

(e) After two years of operating within an approved ATQP an operator may, with

the approval of the Authority, extend the periods of OR.OPS.145.FC follows:

1. operator proficiency check — 12 calendar months in addition to the remainder of the month of issue. If issued within the final three calendar months of validity of a previous operator proficiency check, the period of validity shall extend from the date of issue until 12 calendar months from the expiry date of that previous operator proficiency check;
2. line check — 24 calendar months in addition to the remainder of the month of issue. If issued within the final six calendar months of validity of a previous line check, the period of validity shall extend from the date of issue until 24 calendar months from the expiry date of that previous line check. The line check may be combined with a line oriented quality evaluation (LOQE) with the approval of the authority;
3. emergency and safety equipment checking — 24 calendar months in addition to the remainder of the month of issue. If issued within the final 6 calendar months of validity of a previous check, the period of validity shall extend from the date of issue until 24 calendar months from the expiry date of that previous check.

(f) The ATQP shall be the responsibility of a nominated post holder.

#### **AMC OR.OPS.150.FC - Alternative training and qualification programme**

(a) An operator's ATQP may apply to the following requirements that relate to training and qualifications:

1. Low Visibility Operations –Training and Qualifications.
2. Conversion training and checking.
3. Differences training and familiarisation training.
4. Nomination as commander.
5. Recurrent training and checking.
6. Operation on more than one type or variant.

(b) Components of the ATQP — an alternative training and qualification programme shall comprise the following:

1. Documentation that details the scope and requirements of the programme;
2. A task analysis to determine the tasks to be analysed in terms of:
  - (i) knowledge;
  - (ii) the required skills;
  - (iii) the associated skill based training;
 and, where appropriate
  - (iv) the validated behavioural markers.
3. Curricula — the curriculum structure and content shall be determined by task analysis, and shall include proficiency objectives including when and how those objectives shall be met. The process for curriculum development shall be acceptable to the Authority;
4. A specific training programme for:
  - (i) each aeroplane type/class within the ATQP;
  - (ii) the instructors (Class rating instructor rating/Synthetic flight instructor authorisation/Type rating instructor rating — CRI/SFI/TRI), and other personnel undertaking flight crew instruction;
  - (iii) the examiners (Class rating examiner/Synthetic flight examiner/Type rating examiner — CRE/SFE/TRE); to include a method for the standardisation of the instructors and examiners;
5. A feedback loop for the purpose of curriculum validation and refinement, and to ascertain that the programme meets its proficiency objectives;
6. A method for the assessment of flight crew both during conversion and recurrent training and checking. The assessment process shall include event-

based assessment as part of the LOE. The method of assessment shall comply with the provisions of OR OPS;

7. An integrated system of quality control, that ensures compliance with all the requirements processes and procedures of the programme;

8. A process that describes the method to be used if the monitoring and evaluation programmes do not ensure compliance with the established proficiency and qualification standards for flight crew;

9. A data monitoring/analysis programme.

(c) Implementation

The operator shall develop an evaluation and implementation strategy acceptable to the Authority;

the following requirements shall be fulfilled:

1. The implementation process shall include the following stages:

(i) a safety case that substantiates the validity of:

(A) the revised training and qualification standards when compared with the standards achieved under OR.OPS prior to the introduction of ATQP.

(B) any new training methods implemented as part of ATQP.

If approved by the Authority the operator may establish an equivalent method other than a formal safety case.

(ii) Undertake a task analysis as required by paragraph (b)2 above in order to establish the operator's programme of targeted training and the associated training objectives.

(iii) A period of operation whilst data is collected and analysed to ensure the efficacy of the safety case or equivalent and validate the task analysis. During this period the operator shall continue to operate to the pre-ATQP OR.OPS requirements. The length of this period shall be agreed with the authority;

2. The operator may then be approved to conduct training and qualification as specified under the ATQP.

comment 665 comment by: *AEA*

**Comment:**

The credits to operate more than one type or variants as defined in the Operational Suitability Certificate (O-SC) should be added to the hard-law. This should not be interpreted as AEA support for the current O-SC concept and processes (see AEA comments to NPA 2009-1) but as an AEA/operator desire to get credits from current JOEB processes.

**Proposal:**

OR.OPS.155.FC to add new (c) with similar text as the one of OR.OPS.055.FC, to read:

*(c) Flight crew members operating more than one type or variant of aircraft shall comply with all of the requirements prescribed in this Chapter, unless credits related to the training, checking, and recent experience requirements are identified in the Operational Suitability Certificate issued in accordance with Part 21.*

comment 887 comment by: *ECA - European Cockpit Association*

Comment on OR.OPS.155.FC: Request clarification:

Rewrite requirement in a logic and appropriate way.

**Justification:**

The logic and efficiency of this paragraph is largely destroyed in this draft. It should establish different requirements for:

- operation of different aircraft, and
- operation of aircraft and helicopter.

Since the second is a remote operation, as compared to the use of the first option, it should build on the requirements for operation of different aircraft.

The rationale of EU-OPS that this kind of operation needs to be justified by similarities of the types concerned cannot be omitted or downgraded into AMC.

The process for justification of this operation and the continued safety case must be demonstrated by an operator in appropriate assessment of operation, types and crew qualification.

None of these can be downgraded into AMC.

*(c) Flight crew members operating more than one type or variant of aircraft shall comply with all of the requirements prescribed in this Chapter, unless credits related to the training, checking, and recent experience requirements are identified in the Operational Suitability Certificate issued in accordance with Part 21.*

comment 1570 comment by: REGA

**(a)** Technology, operational procedures, handling characteristics of non-complex helicopters are quite similar. To limit the amount of types without neither consider their complexity nor certified take-off mass (MCTOM) or the maximum passenger seating configuration seems not adequate. A limitation of only one type of each when flying both helicopters and aeroplane independently the complexity of the aircraft does not respect proportionality regarding flight safety targets. As long as the required training and checking is provided, the acceptance of the amount of different types of aircraft a flight crew member may operate shall be the objective of the competent Authority.

**Proposal (a)**

*When a flight crew member operates both helicopters and aeroplanes the competent authority decides, based on the aspects (b) (1)-(4) and the complexity of the aircraft, the maximum of types or variants the flight crew member may operate in combination.*

To be more transparent: The possibility to combine the Operator Proficiency Check with the annual type or class rating or instrument rating proficiency checks in accordance with Part FCL should be mentioned in OR.OPS.240.FC: add letter (d)

**Proposal (d)**

*The annual operator proficiency check may be combined with the annual type or class rating or instrument rating proficiency checks in accordance with Part FCL.*

- comment 1974 comment by: *Southern Cross International*
- Due to the type of operations of our company (test and ferry flights) and taking into consideration the wide variety of aircraft operated by our company, the different equipment fits for each of those aircraft, the extreme short period of time those aircraft are operated, and the fact that the majority of our crews are employed on a contract per flight basis, requiring an operator proficiency check is not practicable as these crew members will be compliant with the training programme established by their regular employer and will also complete recurrent training and checking for the subject type of aircraft with their regular employer.
- comment 2003 comment by: *Austro Control GmbH*
- (a)  
Add at the end the paragraph: ***In addition to these checks the requirements governing of a flight crew licences may be combined with the operator proficiency check.***
- Justification:  
The option that OPC and LPC are in one should be provided to avoid double checks and to reduce costs for all stakeholders.  
Besides that this was already regulated in EU-OPS Appendix 1 to OPS 1.965.
- comment 2206 comment by: *Ted Moore*
- The imposition of annual proficiency checks on non CAT operations is completely unnecessary bearing in mind the excellent safety record over the last thirty years. balloons are simple aircraft and do not require treatment along the same lines as more complicated aircraft. There should be a separate category for Hot Air Balloons encompassing all forms of commercial work including passenger rides.
- comment 2216 comment by: *Christophe Baumann*
- Owing to the high number of checks it should be possible to combine with PPC or other related checks in accordance with the National Authority. Flight crew undergo 14 checks : HELO recency, NVIS (3 missions in 90 days), HHO (3 night hoist cycle in 90 days), HEMS (30 minutes IFR in 6 months), HEMS VMC prof check, HEMS Night prof check, HEMS line check, Recurrent training on each type, CRM annual check, OPS prof. check (check valid 6 months), Emergency and safety check (annual), Ground training (annual), Commercial OPS other than CAT (annual check), dangerous check (2 years).

comment 3462 comment by: Graham HALLETT

OR.OPS.240.FC

The need for annual operator proficiency checks for ballooning operations other than Commercial Air Transport is simply not justified. Leaving aside Commercial Air Transport activities, there are essentially no additional

operational procedures involved than there are for private balloon operations. Thus all that may need to be assessed is the basic pilot competence, which is adequately addressed under the FCL rules. This section should be prefixed with 'Except balloons'

1. **Section VI – Cabin crew**

General comment:

We consider that the attestation and medical requirements go far beyond anything that EU OPS or the Basic Regulation envisaged. In particular, the attestation requirements and mandatory medical standards, which are very close to the standards for private pilots, could impose significant unnecessary costs on industry and authorities. There is no evidence that flight safety, or the safety of passengers during emergency evacuation, has ever been compromised as a result of cabin crew incapacitation.

EASA should only propose to regulate the attestation as required by EU OPS and develop the 'EASA attestation' concept later, as this is not a priority for safety. EASA have also suggested medical requirements for 'technical' crew such as crew undertaking helicopter emergency medical services which are also unnecessary. Technical crew members are defined as passengers and their incapacitation would have no impact on flight safety.

When EASA intend to continue, changes are proposed to the individual points.

There is no clear definition for passenger.

Technical crew members shall not be considered as passengers but as crew members, assigned for a specific task by the operator. Therefore the presence of technical crew members shall not require the assignment of one or more cabin crew members.

Although OR-OPS().TC describes the requirements for some technical crew members in HEMS, HHO and NVIS operations, in other type of operations also technical crew members may be present. Some examples are flight test engineers (see Part 21), flight test instrumentation engineers, load masters, radar operators, system and payload specialists, observers, et cetera. In addition, during acceptance and demonstration flights customer technical representatives and authorities may be present during a flight.

The following definition is proposed for 'passenger' (see comment #3172 to NPA 2009-02b)

A passenger shall mean any person who is present under a contract of carriage or any other person other than a crew member, an owner or operator's employee in an official capacity, an authorized representative of an appropriate national authority or person accompanying a consignment or other cargo.

Comment to (a);

Some alleviation should be given for non-revenue flights carrying only the operator's personnel. For instance, it would be inappropriate to require 3 cabin crew members on a B737 with only a few company staff onboard.

comment by: CAA-NL

Comment regarding:

(b) The cabin crew members and their functions with regard to flight and passenger safety (.../...)

Comment CAA-NL:

How must 'functions' be interpreted and how shall this be identified to the passengers?

Reason: Interpretation differences

comment

667

comment by: AEA

**Relevant Text:**

(b ) The cabin crew members and their functions with regard to flight and passenger safety shall be clearly identified to the passengers

**Comment:**

This definition is different from EU-OPS. In order to create legal certainty the definition should be realigned with EU-OPS Subpart O (OPS 1.988 and OPS 1.989)

**Proposal:**

Cabin Crew Member means any crew member, other than flight crew member, who performs, in the interests of safety of passengers, duties assigned to him/her by the operator or the commander in the cabin of the aeroplane.

An operator shall ensure that all cabin crew members wear the operator's cabin crew uniform and are clearly identifiable to passengers as a cabin crew member

Other personnel, such as medical staff, security staff, child minders, escorts, technical staff, entertainers, interpreters who undertake tasks in the cabin, shall not wear a uniform which might identify them to passengers as cabin crew member, unless they comply with the requirements of this subpart and any other applicable requirements of this regulation,

comment

668

comment by: AEA

**Relevant Text:**

(a) Cabin Crew members shall be assigned to duties on an aircraft only if they:

**Comment:**

'assignment to duties' should be limited to 'assignment to **safety** duties' taking

into account the fact that EASA should only regulate safety but not other elements related to cabin crew.

**Proposal:**

Amend the paragraph to read as '*Cabin Crew members shall be assigned to safety duties on an aircraft only if they*

comment 714

comment by: *Luftfahrt-Bundesamt*

The proposed rule does not mirror JAR-OPS 1.990 completely. Those parts where an operator can reduce the number of CC has been moved to another place; an AMC? We were not able to find it. If it is maintained to downgrade the missing part of the initial rule in OPS 1.990, we do not agree. Instead, the material needs to be re-established in the rule part.

Justification: see LBA - General Comment, reasons 1 and 2

comment 739

comment by: *claire.amos*

(4)

This is not clear as to how and under what frequency. A reference to the training requirements listed elsewhere in this document would be beneficial to operators.

comment 750

comment by: *claire.amos*

(4) (b) **'and their functions'**....this is an addition but what isn't clear is to what extent we need to inform passengers. Is the basic information within the PA's adequate or do we have to go into more detail? Clarification required.

comment 801

comment by: *ETF*

Add: (a) (3) have completed all training required by PartCC and this Chapter to perform the assigned duties;

Add: **(4) holds a cabin crew attestation**, and ~~(4)~~ **(5)** have been checked as proficient to perform all assigned duties.

Reason: A cabin crew attestation will document that they have successfully completed their training and fulfil the ER 7.b. on cabin crew of Regulation 216/2008.

comment 843

comment by: *ECA - European Cockpit Association*

Comment on OR.OPS.110.CC(b): add the following text:

(b) The cabin crew members and their functions with regard to flight and passenger safety shall be clearly identified to the passengers **by wearing the operator's cabin crew uniform**.

Justification:

The requirement to be clearly identifiable to passengers by wearing the operator's uniform has been deleted. In case of an emergency the uniform is of utmost importance in order to safely evacuate an aircraft and steer passengers away from danger.

- comment 844 comment by: *ECA - European Cockpit Association*  
 Comment on OR.OPS.110.CC: request clarification.  
 Justification:  
 The text implies that a cabin crew member can be assigned to duties without a cabin crew attestation, as the attestation is not listed here. This list seems to be a repetition of CC.CCA.100
- comment 856 comment by: *AEA*  
**Relevant Text:**  
 (a)(2)... in accordance with the medical requirements specified in Part-MED as applicable to the type of operations  
**Comment:**  
 There is no safety justification and no legal basis to alter the medical fitness requirements of EU-OPS (see AEA comments to Part-MED). The reference to Part-MED should therefore be deleted and replaced with a copy paste of the EU-OPS medical fitness requirements for cabin crew.  
**Proposal:**  
 Realign with the EU-OPS medical fitness requirements for cabin crew
- comment 1040 comment by: *AEA*  
**Relevant Text:**  
 (a) (2) have been assessed physically and mentally fit to perform all assigned duties and responsibilities safely in accordance with the medical requirements specified in Part-MED as applicable to the type of operations;  
**Proposal:**  
 Refer to exact location in Part Med
- comment 1121 comment by: *Austro Control GmbH*  
 (a) (4):  
 There is no more scope of discretion for the Authority referring to the checking (more legal certainty):  
 So a more precised definiton is suggested:  
*"have been checked after each training in the subjects covered to ensure that the cabin crew member is competent to perform all assigned duties".*  
 (b):  
 The consequence of the omission of "wear the operator's cabin crew uniform" is that cabin crew members are not identifiable to the passengers.  
 Text suggested:  
*"The cabin crew members and their functions with regard to flight and passenger safety shall be clearly identified to the passengers by wearing the operator's cabin crew uniform".*
- comment 1266 comment by: *UK CAA*  
**Page No:** 18  
**Paragraph No:** OR.OPS.110.CC (a) (2) Conditions for assignment of cabin

crew to duties

**Comment:** PART MED proposals are not appropriate for cabin crew.

**Justification:** There is no evidence that the medical requirements specified in Part-MED are evidence based or appropriate to cabin crew (see comments on part MED).

**Proposed Text (if applicable):**

OR.OPS.110.CC (a) (2) Amend to 'have been assessed fit to perform all assigned duties and responsibilities safely'. Delete: "in accordance with the medical requirements specified in Part-Med as applicable to the type of operations;"

comment

1393

comment by: AEA

**Relevant text:**

(a) (4) *have been checked as proficient to perform all assigned duties.*

**Comment:** "**Checked**" in this requirement does not have added value because the checks have already been performed by complying to requirement (a)(3).

**Proposed text:** Use the sentence from EUOPS 1.995 (f): Is competent to perform his/her duties in accordance with procedures specified in the Operations Manual.

comment by: British Airways Flight Operations

**Relevant Text:**

(a)(2)... in accordance with the medical requirements specified in Part-MED as

applicable to the type of operations

**Comment:**

There is no safety justification for, and no legal basis to, alter the medical fitness requirements for cabin crew as contained in EU-OPS (see BA comments to Part-MED). The reference to Part-MED should therefore be deleted and replaced with a copy and paste of the EU-OPS medical fitness requirements for cabin crew.

Work done by Lufthansa estimates that the probability of a cabin crew member being involved in an accident, and being rendered unfit by a condition which would have been detectable at a routine medical, and thereby being unable to assist in an evacuation is between 10E-12 and 10E-13. In other words negligible. There is therefore no requirement for routine cabin crew medical assessment.

**Proposal:**

Realign with the EU-OPS medical fitness requirements for cabin crew

comment

3389

comment by: Konrad Polreich

OR.OPS.110.CC

This paragraph demands in fact almost the same training for cabin crews in the non-commercial ops as for the CAT. The only difference is the training for 'Single cabin crew operations' acc. OR.OPS.255.CC.

Which safety data justifies this extensive regulation of corporate aircraft, when comparing the number and kind of passengers to those on CAT aircraft. Especially when there is no CC required at all on the aircraft, due to MAPSC of (far) less than 19.

Suggestion:

OR.OPS.110.CC

(a) Cabin crew members shall be assigned to duties on an aircraft only if they:

- (1) (i) hold/have held a valid CCA, or

(ii) are at least 18 years old and have a valid medical as specified in Part-MED  
 (2) have completed all training required in this chapter, and Part CC if applicable  
 (3) have undertaken at least one flight on the particular aircraft type during the preceding 6 months  
 (4) have been clearly identified to the passengers about their functions with regard to flight and passenger safety.  
 (b) Cabin crew members in other than CAT-operations, assigned to aircraft with less than 19 MAPSC shall at least comply with:  
 (1) OR.OPS.110.CC (a)(1)(ii),  
 (2) OR.OPS.120.CC,  
 (3) OR.OPS.125.CC and  
 (4) OR.OPS.135.CC  
 The type introduction course acc. OR.OPS.125.CC (b)(3) shall be established by the operator in the Operations Manual or an approved training organisation. It shall be conducted by suitably qualified and experienced personnel.

Amend the paragraph to read as 'Cabin Crew members shall be assigned to safety duties on an aircraft only if they'

comment 3711 comment by: *Icelandair*

**Relevant Text:**

(a)(2)... in accordance with the medical requirements specified in Part-MED as applicable to the type of operations

**Comment:**

There is no safety justification and no legal basis to alter the medical fitness requirements of EU-OPS (see AEA comments to Part-MED). The reference to Part-MED should therefore be deleted and replaced with a copy paste of the EU-OPS medical fitness requirements for cabin crew.

**Proposal:**

Realign with the EU-OPS medical fitness requirements for cabin crew

comment 3796 comment by: *Swedish Transport Agency, Civil Aviation Department (Transportstyrelsen, Luftfartsavdelningen)*

**Comment:**

(2) is very similar, but not identical, to the corresponding requirements for technical crew member in OR.OPS.015.TC (a)(2) and (a)(3). Introduction of similar, but not identical, requirements will be confusing and difficult for the users, especially the examining physicians. This would lead to both an increased administrative burden and a risk for mistakes in the medical assessments with possible negative effects on flight safety. A better approach would be to use identical requirements and procedures for both categories.

**Proposal:**

The medical requirements for CC in OR.OPS.110.CC and those for technical crew member in OR.OPS.015.TC should be identical.

comment 3813 comment by: *IACA International Air Carrier Association*

(a)(2)

EU-OPS 1.995 wording is better.

Proposal: "has passed a medical examination or assessment at regular intervals so as to check the medical fitness to discharge his/her duties."

comment 3815 comment by: *IACA International Air Carrier Association*

(b)

Does this preclude crew operators from positioning cabin crew as passenger on own or other aircraft in uniform? Clarification is required.

Proposal:

The wording contained within OPS 1.989 is adopted.

Identification

(a) An operator shall ensure that all cabin crew members wear the operator's cabin crew uniform and are clearly identifiable to the passengers as a cabin crew member.

comment 3963 comment by: *CUD*

(a)

(2) Supported

Reason: BR 216/2008 ANNEX III, 7.b. Cabin crew members must: (ii) be periodically assessed for medical fitness to safely exercise their assigned safety duties. Compliance must be shown by appropriate assessment based on aero-medical best practice.

comment 3964 comment by: *CUD*

Add: (5) hold a valid cabin crew attestation.

Reason: A cabin crew attestation will document that they have successfully completed their training and fulfil the ER 7.b. on cabin crew of Regulation 216/2008.

comment 802 comment by: ETF

Add: (a) A detailed programme **acceptable to the competent authority** shall be established by the operator for each training course in accordance with the applicable requirements of Part-CC and of this Section as applicable to cover the duties and responsibilities to be performed by the cabin crew members;

Reason: This is a requirement in Part CC and should be reflected here. Approval by the authority was also required in OPS 1.1005/1.1010/1.1015/1.1025.

Replace: (c) Training and checking of each cabin crew member shall be conducted for each training course by **authorised instructors** ~~personnel suitably qualified~~ and experienced for the subject to be covered; and

Comment: ETF call for qualifications standards for cabin crew instructors.

comment 1122 comment by: Austro Control GmbH

(c)

Clarification is suggested for "suitably qualified and experienced", by special AMC if this experience is e.g. years on the job or training as instructor or others.

(d)

Clarification concerning when and in what intervals proficiency is checked.

Proposed text:

*"Checking of the proficiency of each cabin crew member shall be conducted following each training for all training received, except for crew resource management training".*

comment 1267 comment by: UK CAA

**Page No:** 19

**Paragraph No:**

OR.OPS.115.CC - (d)

**Comment:**

New text that requires checking of proficiency of cabin crew for all training except for CRM.

**Justification:**

If the intent is to include checking of proficiency of senior cabin crew, then this should be clarified.

comment 1394 comment by: AEA

**Relevant text:** (d) *Checking of the proficiency.....shall be conducted for all training received, except CRM training.*

**Comment:** It is not necessary to check all training received. For example first aid or AED training is not checked on a fail or pass basis. It is just instructional and has no flight safety value.

**Proposal:** add the wording "Flight Safety":

*Checking of the proficiency.....shall be conducted for all **flight safety** related training received, except CRM training.*

comment by: Konrad Polreich

OR.OPS.115.CC (c)

The term 'suitably qualified and experienced' is not defined.

It would be very difficult for smaller operators, employing only 1 or 2 CC (maybe only part-time or freelance), to have both "type qualified Instructor/Examiner - CC", in order to provide the required type and differences, recurrent and refresher training/checking as well as "supervision" on familiarisation flights.

For some types (especially of smaller corporate jets), there may be no experienced personnel available.

Suggestion:

AMC1 OR.OPS.115.CC Insert No. 3

Suitably qualified and experienced personnel in this respect means personnel, approved by the competent authority to conduct this training. A TRI is considered suitably qualified and experienced to conduct the training according OR.OPS.125.CC (b) and (c) in aircraft with less than 19 MAPSC.

comment

3965

comment by: CUD

Insert:(a) A detailed programme **acceptable to the competent authority** shall be established by the operator for each training course in accordance with the applicable requirements of Part-CC and of this Section as applicable to cover the duties and responsibilities to be performed by the cabin crew members;

The requirement as laid down under Subpart CCA CC.CCA.100 Cabin crew attestation is vigorously rejected as an over bureaucratic requirement which does not serve to add any greater element of safety to that provided by the current EU-OPS 1.1035 noted above.

Proposal: Delete the requirement for a CC Attestation as under CC.CCA.100 Cabin crew attestation in it's entirety.

**C. III. Draft Opinion Part-OR - Subpart OPS - Section VI - Chapter 1 -  
OR.OPS.125.CC Operator's aircraft type training and differences training**

p. 19

comment 613

comment by: claire.amos

Confirmation required: Will it be necessary to cover all elements listed here if they are identical to current SOPs? Under EU-OPs we are permitted to tailor differences training to our operation.

Potential cost impact as differences training will need to be carried out at LTN in order to be conducted in the sim.

What is the value of including CRM in differences training when it is covered annually in recurrent training? EU-OPs allows us to omit CRM training if Operator's CRM has already been completed.

2492

comment by: *M Wilson-NetJets***Original text:**

(a) A cabin crew member shall undergo appropriate aircraft type training in accordance with (c) before being:

- (1) first assigned by the operator to act as a cabin crew member; or
- (2) assigned by that operator to operate on another aircraft type.

(b) In addition to (a), a cabin crew member shall undergo appropriate differences training in accordance with (c) as applicable before they are assigned:

- (1) on a variant of an aircraft type currently operated; or
- (2) on currently operated aircraft types or variants with different safety equipment, safety equipment location or normal and emergency safety procedures.

(c) The programme of the operator's aircraft type training, and differences training as relevant, shall:

- (1) involve training and practice on a representative training device or on the actual aircraft;
- (2) comprise training in the operator's standard operating procedures for cabin crew members to be first assigned to duties by the operator; and

(3) cover in addition to the aircraft typespecific training subjects specified in PartCC at least the following subjects as relevant to the aircraft type or variant to be operated:

- (i) description of the cabin configuration;
- (ii) location, removal and use of all portable safety equipment carried onboard the aircraft type or variant;
- (iii) the operator's normal and emergency procedures; (iv) passenger briefing, safety demonstrations and crowd control; (v) fire and smoke training using the operator's equipment; (vi) the operator's evacuation procedures; (vii) pilot incapacitation; and (viii) the operator's crew resource management training.

**Suggested new text:**

(a) A cabin crew member shall undergo appropriate aircraft type training in accordance with (c) before being:

- (1) first assigned by the operator to act as a cabin crew member; or
- (2) assigned by that operator to operate on another aircraft type.

(b) In addition to (a), a cabin crew member shall undergo appropriate differences training in accordance with (c) as applicable before they are assigned:

- (1) on a variant of an aircraft type currently operated; or
- (2) on currently operated aircraft types or variants with different safety equipment, safety equipment location or normal and emergency safety procedures.

(c) The programme of the operator's aircraft type training, and differences training as relevant, shall:

**(1) involve training and practice by means of the appropriate training tools and support representative of the complexity of the cabin and its associated emergency features;**

(2) comprise training in the operator's standard operating procedures for cabin crew members to be first assigned to duties by the operator; and

(3) cover in addition to the aircraft typespecific training subjects specified in PartCC at least the following subjects as relevant to the aircraft type or variant to be operated:

- (i) description of the cabin configuration;
- (ii) location, removal and use of all portable safety equipment carried onboard the aircraft type or variant;
- (iii) the operator's normal and emergency procedures;
- (iv) passenger briefing, safety demonstrations and crowd control;
- (v) fire and smoke training using the operator's equipment;
- (vi) the operator's evacuation procedures;
- (vii) pilot incapacitation; and
- (viii) the operator's crew resource management training.

**Comment/suggestion:**

The complexity of the cabin and associated equipment dictate the sophistication of the required training tools. Current or future operation of emergency exits or other features of the cabin that need to be operated by cabin crew may be designed so simple that they do not require training on the actual aeroplane or a representative training device. In these circumstances it might be sufficient to have a CBT or other form of training to actually provide an equivalent level of ability and associated safety. Therefore the dictated training device or level of sophistication of a training tool must be moved to the AMC so that manufacturers and operators have the maximum flexibility in designing effective training tool and be more cost effective to increase

competitiveness.

comment by: CUD

**Comment:**

The term *appropriate* does not provide legal certainty; AMC or GM should provide guidance on what is appropriate.

comment

3968

comment by: CUD

**Insert:**

After completion of a training course on an aircraft type or a variant, a cabin crew member with no previous comparable experience shall complete **appropriate** familiarisation under **supervision by an authorised cabin crew instructor** before being assigned as one of the minimum number of cabin crew required for the aircraft type or variant.

Reason:

According to **CC.TRA.115 Conduct of training courses, examination and checking**

The training courses and the associated examination or checking specified in this Part shall:

(c) be performed by personnel suitably qualified and experienced.

Authorised cabin crew instructors would be suitably qualified and experienced; Familiarisation is to be considered as a part of the instruction process and should be supervised by qualified instructors.

**AMC OR.OPS.130.CC Familiarisation** establishes in

3.2 Familiarisation flights should:

a. be conducted under the supervision of the senior cabin crew member;

Senior cabin crew members should not be considered as suitably qualified to conduct checking or training. **OR.OPS.260.CC Senior cabin crew member** (b) describing the senior cabin crew member training course does not include any training on how to conduct familiarisation. Therefore familiarisation should be reserved to suitably qualified cabin crew instructors.

Comment regarding:  
(8) aeromedical aspects and first aid; and (.../...)

Comment CAA-NL:  
CAA-NL advises to divide the first-aid training yearly and in 3 yearly items.

comment 429

comment by: CAA-NL

*Comment I regarding:*  
(9) security procedures.

Comment CAA-NL:  
The topic 'Security Procedures should be changed in 'operator security procedure training'

*Comment II regarding:*  
(i) actually fighting a fire using the operator's equipment; and (.../...)

Comment CAA-NL:  
The use of operators equipment in practical fire fighting training is not reasonable

*Comment III regarding:*  
(ii) undergoing pilot incapacitation training if applicable;

Comment CAA-NL:  
Pilot incap training shall always be covered in the 3 yearly training.

comment by: *Royal Aeronautical Society*

**Commentor:** Royal Aeronautical Society Human Factors Cabin Crew Standing Group

**Page No:** 20

**Paragraph No:** OR.OPS.135.CC (c) (1) (ii) - Recurrent

**Comment:** Text requires practical pilot incapacitation but does not include practical door operation in order to access the flight deck.

**Justification:** Recent accidents such as Helios have shown possible lack of familiarity with operation of the flight deck security door particularly in emergency situations. Current training could be achieved theoretically and could result in a cabin crew member being unfamiliar with the door operation. There is also no requirement for training in the use of this door during Recurrent training.

**Proposed Text (if applicable):** Add onto text - '*undergoing pilot incapacitation training if applicable and practical operation of the flight deck security door in both normal and emergency modes*'.

comment 3148 comment by: DGAC

In EU OPS, Appendix 3 to OPS 1.1005/1.1010/1.1015 details the items that shall be included in the "Medical aspects and first aid training". The list of items of appendix 3 has not been located in Part OR nor in Part CC.

Nevertheless, the number of items listed in appendix 3 to OPS 1.1005/1.1010/1.1015 is deemed to be too long for a yearly recurrent training. While some practical exercises and items should be kept on a yearly revision, some others items less critical should be revised on a 3 year basis.

The item "(8) aeromedical aspects and first aid" should be completed by a provision in (c) and AMC or guidance material should be developed to distribute Med & FA items in the yearly or 3 year recurrent training.

comment 3265 comment by: cfdt france

**CFDT France** :Comment to (c) (1) (ii)

The pilot incapacitation training if applicable should be explained. In OPS the guideline is "unless where flight crew is more than 2 pilots".

comment 3612 comment by: AIR FRANCE

Comment:

Based on experience, the added value of a mandatory yearly cycle for all aero-medical and first aid training can be questioned. We suggest to change it to a interval not exceeding 3 years

Proposal:

All aero-medical aspects and first aid to be trained to an interval not exceeding three years

comment 3613 comment by: AIR FRANCE

Comment:

Align this provision with the same principle used for flight crew recurrent training

Proposal:

All the validity periods mentioned shall be counted from the end of the month when the training or check was taken.

When the training or checks required above are undertaken within the last 3 months of the validity period, the new validity period shall be counted from the original expiry date.

comment 3614 comment by: AIR FRANCE

comment by: *Austro Control GmbH*

For the whole paragraph:

according to this text it would be allowed to do the training on any aircraft type, which seems not to fit with safety standards.  
therefore it is suggested to keep the EU-OPS term "*refresher training on type*"

(c):

Keep the EU-OPS version of App. 1 to OPS1.1020.

Justification:

the new version is less precise, possibly important issues would then not be covered and touch safety concerns.

Comment

IEM OPS 1.1020(a) allows refresher training to be substituted with recurrent training if the re-instatement of the CCM's flying duties commences within the validity period of the last recurrent training and checking. This measure allows operators to plan CCMs into already planned and resourced recurrent training. Of course, the content of the recurrent training must be in excess of the requirements proposed in OR.OPS.140CC Operator's Refresher Training. The competent authority must approve such training and procedures.

It would not be uncommon for refresher training to be required for a single CCM. Such a refresher training course will require an Instructor, a location and the administration of the roster and training records. This is an unnecessary expense that could be avoided if the measures contained in the above mentioned IEM are retained.

Proposal

The contents of IEM 1.020(a) be included in part OR.OPS/CC.

comment

2494

comment by: *M Wilson-NetJets***Original text:**

- (a) A cabin crew member who has not undertaken any flying duties for more than 6 months shall undergo a refresher training on the aircraft type to be operated before being assigned to duties.
- (b) A cabin crew member who has not undertaken flying duties on one particular aircraft type during the preceding 6 months shall before being assigned on that type complete either:
- (1) the applicable refresher training in accordance with (c); or

- (2) 2 refresher sectors on the aircraft type under appropriate supervision.  
 (c) The refresher training programme for each aircraft type shall cover as a minimum:
- (1) emergency procedures;
  - (2) evacuation procedures;
  - (3) actual operation and opening by each cabin crew member of each type or variant of normal and emergency exits in the normal and emergency modes;
  - (4) demonstration of the operation of all other exits; and
  - (5) location and handling of all safety and emergency equipment carried
- Suggested new text:**

(a) A cabin crew member who has not undertaken any flying duties for more than **a predetermined period of time, as determined by the operator and dependent from the complexity of the cabin and associated features**, shall undergo a refresher training on the aircraft type to be operated before being assigned to duties.

(b) A cabin crew member who has not undertaken flying duties on one particular aircraft type for a predetermined period of time, as determined by the operator and dependent from the complexity of the cabin and associated features, shall before being assigned on that type complete either:

- (1) the applicable refresher training in accordance with (c); or
  - (2) **2 refresher** sectors on the aircraft type under appropriate supervision.
- (c) The refresher training programme for each aircraft type shall cover as a minimum:
- (1) emergency procedures;
  - (2) evacuation procedures;
  - (3) actual operation and opening by each cabin crew member of each type or variant of normal and emergency exits in the normal and emergency modes;
  - (4) demonstration of the operation of all other exits; and
  - (5) location and handling of all safety and emergency equipment carried

**Comment/suggestion:**

The need for refresher training depends greatly on the complexity of the cabin and its associated features. Therefore, the actual timeframe after which a refresher training must be accomplished should be variable with that complexity. The actual timeframe should be moved to the AMC and allow operators to submit different timeframes in an AMC by simultaneously proving equal or better safety.

**C. III. Draft Opinion Part-OR - Subpart OPS - Section VI - Chapter 2 -  
OR.OPS.205.CC Number and composition of cabin crew**

p. 21

comment 311

comment by: EHOc

Paragraph (a)

This understanding of this text might be improved with some punctuation or simplification. Isn't really just saying:

"The minimum number of cabin crew members shall be the greater of:

(1) that specified by the certification requirement of Part 21; or

(2) that specified in OR.OPS.105.CC."

comment 381

comment by: Condor Flugdienst GmbH - FRA HO/R

Referring to OR.OPS.205.CC Para (e): We, Condor Flugdienst GmbH, suggest the prohibition of Defuelling with PAX on board, embarking or disembarking.  
Reason: ICAO 9137, Part I, §16.3.3.!

comment 756

comment by: claire.amos

The line in EU-OPS 1.990 stating procedures for reducing crew must be specified in the operations manual has been removed. It is felt that this line

should be reinstated.

(3)(e) This procedure currently states (OPS 1.311) that 'when the number of passengers remaining are less than 20 only the SCCM needs to be in the cabin' - this has been removed from this statement. It is recommended that the current process in EU-Ops remains as there is no evidence to show any benefit to the change.

comment 777

comment by: *claire.amos*

**(d)(2)(i)(ii)**

This would allow us to operate A319/320 with just 2 cabin crew and 100 pax in a reduced crew operation scenario. This would be a significant change requiring new SOPs to be written for this scenario.

comment

845

comment by: *ECA - European Cockpit Association*

Comment on OR.OPS.205.CC (d) (2) & (3): Move (3) up to before (2) and re-number: change as follows:

(d) The minimum required number of cabin crew members determined in accordance with

(a) may be reduced in unforeseen circumstances provided that:

(1) the number of passengers has been reduced, taking particular account of the special categories of passengers carried, if any;

~~(2) there is at least:~~

~~(i) 1 cabin crew member for every 50, or fraction of 50, passengers carried on the same deck of the aircraft; or~~

~~(ii) 1 cabin crew member per pair of floor level emergency exits, whichever number is the greater; and~~

(2) a report is submitted to the competent authority after completion of the flight.

~~(3) a report is submitted to the competent authority after completion of the flight.~~

(3) there is at least:

(i) 1 cabin crew member for every 50, or fraction of 50, passengers carried on the same deck of the aircraft; or

(ii) 1 cabin crew member per pair of floor level emergency exits, whichever number is the greater; and

Justification:

Logical error: (3) is connected only to (2) (ii) by the word "and". If (2) (i) applies, then there is no connection to (3).

**Comment:**

"(a)" was not in EU-OPS. Operator has no influence on Part-21, especially variants of 1 type. Via the Operations Manual there's a link with Part 21.Keep text in "(a)" as was in EU-OPS.

**Proposal:**

(a) An operator shall not operate an aeroplane with a maximum approved passenger seating configuration of more than 19, when carrying one or more passengers, unless at least one cabin crew member is included in the crew for the purpose of performing duties, specified in the Operations Manual, in the

interests of the safety of passengers.

comment

1272

comment by: UK CAA

**Page No:** 21

**Paragraph No:**  
OR.OPS.205.CC - (a)

**Comment:**

There is no indication of what should happen if an operator has less than the same number of seats.

**Justification:**

This could allow operations with a lesser number of cabin crew than previously required by EU-OPS and could affect safety standards. NPA 2009-02a (Explanatory Note) stated that the Commission recommended that requirements be based, as much as possible, on existing material in EU-OPS.

**Proposed Text (if applicable):**

Revert to the spirit of text that was in JAR-OPS and EU-OPS – ..if the maximum approved passenger seating configuration is less than the number determined in accordance with Part 21 by at least 50 seats, the number of cabin crew may be reduced by 1 for every whole multiple of 50 seats by which the maximum approved passenger seating configuration falls below the certificated maximum capacity.

comment

1274

comment by: UK CAA

**Page No:** 21

**Paragraph No:**  
OR.OPS.205.CC - (a)

**Comment:**

There is no requirement for there to be at least one cabin crew member per pair of floor level exits as part of the minimum required number of cabin crew.

**Justification:**

Aeroplanes with significantly reduced passenger seating configurations may require a lesser number of cabin crew than there are pairs of floor level exits, for normal operation, but will be required to have at least that many when reducing cabin crew in unforeseen circumstances and during ground operations. (E.g. Current B757 operation with 64 passenger seats installed would require 2 cabin crew for normal operation, yet 4 for fuelling and unforeseen circumstances.)

**Proposed Text (if applicable):** OR.OPS.105.CC (b) The cabin crew shall be composed of at least one cabin crew member for every 50 or fraction of 50, passenger seats installed on the same deck of an aircraft, or one cabin crew member per pair of floor level emergency exits, whichever number is the greater.

comment

1275

comment by: UK CAA

**Page No:** 21

**Paragraph No:**

OR.OPS.205.CC - (d)

**Comment:**

The requirement for a procedure to be in the Operations Manual has been removed.

**Justification:**

A lack of procedure in order to reduce below minimum cabin crew will result in not only non-standardisation between operators, but also non-standardisation within operators, as the procedure could be determined on the day by the flight crew.

**Proposed Text (if applicable):**

(d) (1) the number of passengers has been reduced in accordance with procedures specified in the Operations Manual.

Include: If the maximum approved passenger seating configuration is less than the number evacuated during the demonstration by at least 50 seats, the number of cabin crew may be reduced by 1 for every whole multiple of 50 seats by which the maximum approved passenger seating configuration falls below the certified capacity

comment

1709

comment by: Thomas Cook Airlines

**Justification:**

Appears to remove the current requirement to have procedures for reduced

crew operation in the Ops manuals

Proposal:

(d) 3) the number of passengers has been reduced in accordance with procedures specified in the Operations manual

4) a report is submitted to the competent authority after completion of the flight.

comment 1711

comment by: *Thomas Cook Airlines*

Justification:

Current requirement to allow a reduction in number of crew required if less than 20 passengers remaining on board during ground operations has been removed. Has this has no significant effect on safety suggest the reinstatement.

Proposal:

(b) During disembarkation when the number of passengers remaining on board is less than 20, the minimum number of cabin crew present in the passenger cabin may be reduced below the minimum number of cabin crew required in accordance with OR OPS 205 provided that:

1. the operator has established a procedure for the evacuation of passengers with this reduced number of cabin crew that has been accepted by the Authority as providing equivalent safety; and
2. the senior cabin crew member is present in the passenger cabin. Minimum number of cabin crew required to be on board an aeroplane during ground operations with passengers

When developing the procedure(s) the following should be taken into account:

- a. The possibility of gathering the remaining passengers in one part of each deck or of the deck, depending upon their initial seat allocation,
- b. The possible occurrence of refuelling/defuelling,
- c. The associated number and distribution of cabin crew and the possible presence of flight crew on board, until the last passenger has disembarked

comment 1734

comment by: *ETF*

New:

(d)

The minimum required number of cabin crew members determined in accordance with

(a) may be reduced in unforeseen circumstances provided that:

(1) the number of passengers has been reduced, taking particular account of the special categories of passengers carried, if any;

(2) there is at least:

(i)

1 cabin crew member for every 50, or fraction of 50, passengers carried on the same deck of the aircraft; or

(ii) 1 cabin crew member per pair of floor level emergency exits, whichever

number is the greater; and

(3)

a report is submitted to the competent authority after completion of the flight.

**(4) the operator has an evacuation procedure acceptable to the competent authority for operation with reduced cabin crew.**

Reason: When less than minimum cabin crew the operator should establish an evacuation procedure.

comment 1839

comment by: Jill Pelan

CFDT France asks

New:

(d)

The minimum required number of cabin crew members determined in accordance with

(a) may be reduced in unforeseen circumstances provided that:

(1) the number of passengers has been reduced, taking particular account of the special categories of passengers carried, if any;

(2) there is at least:

(i)

Comment to (a);

Reading this paragraph, it seems that it will not be possible to operate an aircraft with less cabin crew than determined by the number of seats in the type certificate (MAPSC) As it is today, a number of operators has received an approval for operating with less seats than defined in the Type Certificate. For instance, reducing the seats from 151 to 149 will reduce the number of required cabin crew members from 4 to 3, and are a common practise today. This possibility should be allowed to continue, as the opposite has no proven

effect on increased flight safety standards.

comment 3088

comment by: ERA

[European Regions Airline Association Comment](#)

- Referenced:

'(d) The minimum required number of cabin crew members determined in accordance with (a) may be reduced in unforeseen circumstances provided that:

(2) There is at least:

- (i) 1 cabin crew member for every 50, or fraction of 50, passengers carried on the same deck of the aircraft; or
- (ii) 1 cabin crew member per pair of floor level emergency exits, whichever number is the greater; and'

The requirements stated in (d)(2)(i) and (d)(2)(ii) are new and not introduced in the explanatory notes. Whilst (2)(i) is normal practise and acceptable, (2)(ii) is totally new and absolutely not justified (under unforeseen circumstances). Such a requirement was originally rejected following the comments on NPA OPS 45 (ref page 16/29 of the discussion on 1.990 (d) and 1.311: OST also rejected that the requirements of 1.311 be applicable under unforeseen circumstances).

Retaining such a requirement would prevent F50s, ATRs, DHC-8s, Bae146s, AVRO RJs, E-jets, etc. all equipped with 2 pairs of floor level emergency exits from being operated with 1 CC, although the 50 seaters are certified for operation with 1 CC and the others have been flown for years with 1 CC under unforeseen circumstances with no record of incident (due to the mitigation brought by the reduction to 50 passengers max). Additionally, there is no reason to allow operation of F70 or F100 with 1 CC and not Bae 146 or E-jets: the more doors, the more likely passengers will egress.

Therefore, the ERA Directorate suggest that (d) (2) be modified as follows:

(2) there is at least 1 cabin crew member for every 50, or fraction of 50, passengers carried on the same deck of the aircraft; and

~~(i) 1 cabin crew member for every 50, or fraction of 50, passengers carried on the same deck of the aircraft; or~~

~~(ii) 1 cabin crew member per pair of floor level emergency exits, whichever number is the greater; and~~

- Referenced

'(e) During ground operations, when the aircraft is at its parking station and one or more passengers are on board, the minimum required number of cabin

crew members may be reduced only if:

(1) the number of cabin crew members present on board complies with the number required in **(d) (2) above;**'

As mentioned when commenting OR.OPS.205.CC paragraph (d), the requirements for 1 CC per pair of floor level exit cannot not apply for 50 seaters or less certified with 1 CC or for any other type under unforeseen circumstances. In addition the requirement of OPS 1.315 (a) already does not work for the 50 seaters/2 pairs of floor exits and does not apply under unforeseen circumstances (the "reduction" allowance does not apply under unforeseen circumstances)

Therefore, the ERA Directorate suggest that (e) (1) be modified as follows:

~~(1) the number of cabin crew members present on board complies with the number required in (d) (2) above;~~

comment

3156

comment by: *Vairis VELDE*

Reduction of number of passengers, taking particular account of the special categories of passengers carried, if any, in order to reduce minimum required number of cabin crew members in unforeseen circumstances is in conflict with an objective of Regulation (EC) No 1107/2006 of the European Parliament and of the Council of 5 July 2006 concerning the rights of disabled persons and persons with reduced mobility when traveling by air where it is emphasized that disabled persons and persons with reduced mobility shall have opportunities for air travel comparable to those of other citizens.

comment

3253

comment by: *Ryanair*

(d)(2)(ii)

This proposal would appear to prevent paragraph (i) from being implemented. The majority of commercial jet aircraft that carry 200 passengers or less has 4 floor level exits. This proposal would preclude the majority of short haul operators from dispatching with less than the required number of cabin crew (e.g. B737-800 - 4 cabin crew members required and 4 floor level emergency exits). The provision "whichever number is the greater" must therefore be removed.

CFDT France asks

New: *(d)*

The minimum required number of cabin crew members determined in accordance with

(a) may be reduced in unforeseen circumstances provided that:

(1) the number of passengers has been reduced, taking particular account of the special categories of passengers carried, if any;

(2) there is at least:

(i)

1 cabin crew member for every 50, or fraction of 50, passengers carried on the same deck of the aircraft; or

- (ii) 1 cabin crew member per pair of floor level emergency exits, whichever number is the greater; and  
 (3) a report is submitted to the competent authority after completion of the flight.

**(4) the operator as an evacuation procedure acceptable to the competent authority for operation with reduced cabin crew.**

Reason: When less than minimum cabin crew the operator should establish an evacuation procedure.

comment

3341

comment by: Lufthansa CityLine GmbH

d  
 (2)

The requirements stated in (2)(i) and (2)(ii) are new and not introduced in the explanatory notes. Whilst (2)(i) is normal practise and acceptable, (2)(ii) is totally new and absolutely not justified (under unforeseen circumstances). Such a requirement was originally rejected following the comments on NPA OPS 45 (ref page 16/29 of the discussion on 1.990 (d) and 1.311: OST also rejected that the requirements of 1.311 be applicable under unforeseen circumstances).

Retaining such a requirement would prevent F50s, ATRs, DHC-8s, Bae146s, AVRO RJs, E-jets, etc. all equipped with 2 pairs of floor level emergency exits from being operated with 1 CC, although the 50 seaters are certified for operation with 1 CC and the others have been flown for years with 1 CC under unforeseen circumstances with no record of incident (due to the mitigation brought by the reduction to 50 passengers max). Additionally, there is no reason to allow operation of F70 or F100 with 1 CC and not Bae 146 or E-jets: the more doors, the more likely passengers will egress.

Therefore, Lufthansa CityLine suggests that (d) be modified as follows:

d) The minimum required number of cabin crew members determined in accordance with (a) may be reduced in unforeseen circumstances provided that:

1) the number of passengers has been reduced, taking particular account of the special categories of passengers carried, if any;

2) there is at least 1 cabin crew member for every 50, or fraction of 50, passengers carried on the same deck of the aircraft; and

.....

e

As mentioned when commenting OR.OPS.205.CC paragraph (d), the requirements for 1 CC per pair of floor level exit cannot not apply for 50 seaters or less certified with 1 CC or for any other type under unforeseen circumstances. In addition the requirement of OPS 1.315 (a) already does not work for the 50 seaters/2 pairs of floor exits and does not apply under unforeseen circumstances (the "reduction" allowance does not apply under unforeseen circumstances)

Therefore, Lufthansa CityLine suggests that (d) be modified as follows:

e) During ground operations, when the aircraft is at its parking station and one or more passengers are on board, the minimum required number of cabin crew members may be reduced only if:

~~1) the number of cabin crew members present on board complies with the number required in (d) (2) above;~~

2) no refuelling/defueling is taking place; and  
 3) procedures to be applied with this reduced number of cabin crew are established in the operations manual.

(ii) 1 cabin crew member per pair of floor level emergency exits, whichever number is the greater; and' The requirements stated in (d)(2)(i) and (d)(2)(ii) are new and not introduced in the explanatory notes. Whilst (2)(i) is normal practise and acceptable, (2)(ii) is totally new and absolutely not justified (under unforeseen circumstances). Such a requirement was originally rejected following the comments on NPA OPS 45 (ref page 16/29 of the discussion on 1.990 (d) and 1.311: OST also rejected that the requirements of 1.311 be applicable under unforeseen circumstances). Retaining such a requirement would prevent F50s, ATRs, DHC-8s, Bae146s, AVRO RJs, E-jets, etc. all equipped with 2 pairs of floor level emergency exits from being operated with 1 CC, although the 50 seaters are certified for operation with 1 CC and the others have been flown for years with 1 CC under unforeseen circumstances with no record of incident (due to the mitigation brought by the reduction to 50 passengers max). Additionally, there is no reason to allow operation of F70 or F100 with 1 CC and not Bae 146 or E-jets: the more doors, the more likely passengers will egress.

Therefore, we suggest that (d) (2) be modified as follows:

(2) there is at least 1 cabin crew member for every 50, or fraction of 50, passengers carried on the same deck of the aircraft; and

And delete (i) 1 , (ii) 1

- Referenced

'(e) During ground operations, when the aircraft is at its parking station and one or more passengers are on board, the minimum required number of cabin crew members may be reduced only if:

(1) the number of cabin crew members present on board complies with the number required in

(d) (2) above;'

As mentioned when commenting OR.OPS.205.CC paragraph (d), the requirements for 1 CC per pair of floor level exit cannot not apply for 50 seaters or less certified with 1 CC or for any other type under unforeseen circumstances. In addition the requirement of OPS 1.315

(a) already does not work for the 50 seaters/2 pairs of floor exits and does not apply under unforeseen circumstances (the "reduction" allowance does not apply under unforeseen circumstances)

Therefore, we suggest that (e) (1) be modified as follows:

Please delete

~~(1) the number of cabin crew members present on board  
complies with the number required in (d) (2) above;~~

comment 3969

comment by: CUD

(b) The operator shall take into account the type and duration of operations when determining the number and composition of the cabin crew.

Comment: This is of no practical use as it fails to establish on how type and duration of operations should be taken into account. The corresponding **AMC OR.OPS.205.CC number and composition of cabin crew**

*'DETERMINATION OF THE NUMBER AND COMPOSITION OF CABIN CREW*

*1 Factors to be taken into account when determining the minimum number of cabin crew should include:*

*1.7 the type and duration of the flight to be operated.'*

should establish criteria on how to take type and duration of operations into account in order to provide legal certainty and harmonization.

comment 3970

comment by: CUD

Add: (d)

**(4) the operator has an evacuation procedure acceptable to the competent authority for operation with reduced cabin crew.**

Reason: In case of an unforeseen emergency all crew members should be aware of their changed duties due to the reduction of the number of cabin crew members. The resulting procedure should be part of initial and eventually recurrent training.

Comment CAA-NL:

What is the definition of compatible with the safety functions of cabin crew.

comment 614

comment by: claire.amos

OR.OPS.210.CC (b) (1)

Operational Impact: If a crew member is qualified, they should be permitted to 'deadhead' in uniform. This will have a significant impact on our operation as we regularly position crew to an alternative base to operate immediately. Crew who are SICK down route would no longer be able to be flown home. Recurrent training would no longer be held in uniform as trainees position in uniform from all around the network.

OR.OPS.210.CC (b) (2)

Clarification required: How will this impact on ground agents who wear an identical uniform to cabin crew?

comment 757

comment by: *claire.amos*

(b)(1) Clarification required. In the event of crew incapacitation during their duty it would not be practical or ethical to expect the crew member to change clothing. It would be uneconomical and indecent to expect crew to change out of civvies in to their uniform after positioning to operate a straight after disembarkation.

comment 847

comment by: *ECA - European Cockpit Association*

Comment on OR.OPS.210.CC (b) (1): delete as follows:

(b) The operator shall also ensure that:

~~**(1) all and only the cabin crew members assigned to duties on a flight wear the operator's cabin crew uniform, and**~~

(2) such uniform is compatible with the safety functions of cabin crew and is clearly identifiable to the passengers.

Justification:

This means that flying as passenger is not permitted if the crew member wears a uniform. Many States require that "dead-head" crew members (proceeding?) pass immigrations in uniform. In addition: This means that private travel to/from duty is also prohibited in uniform – completely unacceptable!

comment 848

comment by: *ECA - European Cockpit Association*

Comment on OR.OPS.210.CC: add the text as follows:

(a) The operator shall:

(1) only assign cabin crew members **to duty** holding a cabin crew attestation issued in accordance with PartCC.

Justification:

Assign to what?

comment 874

2495

comment by: M Wilson-NetJets

**Original text:**

(a) The operator shall:

(1) only assign cabin crew members holding a cabin crew attestation issued in accordance with PartCC.

(b) The operator shall also ensure that:

- (1) all and only the cabin crew members assigned to duties on a flight wear the operator's cabin crew uniform; and
- (2) such uniform is compatible with the safety functions of cabin crew and is clearly identifiable to the passengers.

**Suggested new text:**

(a) The operator shall:

(1) only assign cabin crew members holding a cabin crew attestation issued in accordance with PartCC.

(b) The operator shall also ensure that:

- (1) **all and only the cabin crew members assigned to duties on a flight wear the operator's cabin crew uniform unless for aeroplanes with a MPSC of 19 or less and only one crew member on board not assigned cabin crew duties may wear the company cabin crew uniform if it is clearly communicated to the passengers that he/she does not perform any safety related items other than a normal y expected from a passenger;** and

(2) such uniform is compatible with the safety functions of cabin crew and is clearly identifiable to the passengers.

**Comment/suggestion:**

For aeroplanes with an MPSC of 19 or less do not require Cabin Crew to be on board or to perform safety onboard. Operators should be provided to have the

flexibility to allow Cabin Crew to act in a capacity other than that required for the safety of the passengers on aeroplanes with an MPSC of 19 or less without having to provide separate uniforms. This will significantly increase the operating cost for such an operator. The main objective for this provision is to guarantee the safety of the passengers during a emergency situation so that the Cabin Crew, who is responsible for their safety is readily recognizable and a non-Cabin Crew member is not mistakenly identified as a Cabin Crew. During an operation with only cabin one representative there is no danger in mistakenly identifying this representative as a cabin crew because there is only one representative as such.

comment

2575

comment by: *British Airways Flight Operations***Relevant Text:**

(b) The operator shall also ensure that:

(1) all and only the cabin crew members assigned to duties on a flight wear the operator's cabin crew uniform; and

(2) such uniform is compatible with the safety functions of cabin crew and is clearly

identifiable to the passengers.

**Comment:**

The requirement to make the cabin crew identifiable is already adequately covered in OR.OPS.110.CC (B). As written, the requirement that only cabin crew assigned to duties on a flight wear the operator's cabin crew uniform differs from EU-OPS Subpart O and would create major problems for positioning flights of cabin crew who wear the operator's uniform – either on duty or as fare-paying passengers. This proposal is therefore completely unacceptable to British Airways.

**Proposal:**

Delete (b) and realign with EU-OPS

**General Comment:**

NPA 2009-2 in its entirety is unfit for the purpose for which it is intended and must be withdrawn and reconsidered.

**OPS 210 CC**

(2) such uniform is compatible with the safety functions of cabin crew and is clearly

identifiable to the passengers.

*CFDT France comment : What is compatible ? Does this mean the height of shoe heels, type of skirts,Trousers.... ?This must be clearly explained otherwise it cannot be legally binding.*

*What is "clearly identifiable to the passengers " - does this mean that a badge or minor article of clothing would be suitable?*

**THE CFDT FRANCE UNION asks for more clarity in this provision.**

Comment to (b): It is vital for passengers that they in an emergency situation easily can **identify cabin crew by the operator's uniform.**

comment

comment by: IATA

**(b) The operator shall also ensure that:**  
**(1) all and only the cabin crew members assigned to duties on a flight wear the operator's cabin crew uniform;**

**2. There is no safety reason apparent why crew members flying "dead head" should not wear the uniform. On the contrary they are recognisable and could be of helpful if necessary.**

**(a) The operator shall:**

**(1) only assign cabin crew members holding a cabin crew attestation issued in accordance with PartCC.**

**Comment:**

**Assigning supplemental cabin crew, not having a attestation, should also be possible. (E.g. service specific cabin crew).**

**Proposal:**

**Following the successful completion of a training course and associated checking, the operator shall provide each cabin crew member with an updated list showing the validity period of the related training and checking of the aircraft type(s) and variant(s) on which the cabin crew member is proficient.**

**Comment:**

**The list is an addition to E U-OPS and an administrative burden. Recency and proficiency are an operators responsibility and records are kept digital most of the time.**

**Proposal:**

**Delete OR.OPS.215.CC 0**

comment by: AIR FRANCE

Relevant Text:

**(b) The operator shall also ensure that:**

**(1) all and only the cabin crew members assigned to duties on a flight wear the operator's cabin crew uniform; and**

**(2) such uniform is compatible with the safety functions of cabin crew and is clearly identifiable to the passengers.**

Comment:

The requirement to make the CC identifiable is already adequately covered in OR.OPS.110.CC (B). As written, the requirement (that only cabin crew assigned to duties on a flight wear the operator's cabin crew uniform) is not in line with EU-OPS Subpart O and it would create major problems for positioning

flights of cabin crew who wear the operator's uniform or in the case of OR.OPS.140CC when a cabin crew has to perform his/her 2 refresher legs. Distinctive signs and announcement to passenger adequately provide a way to comply with the distinction requirement.

The compatibility of the uniform is not easy to accurately define, therefore, it is proposed to move this paragraph into a GM.

Proposal:

Delete (b) (1), transfer (b) (2) into a Guidance Material

comment 3619

comment by: AIR FRANCE

Relevant

Text:

(a) The operator shall:

(1) only assign cabin crew members holding a cabin crew attestation issued in accordance with PartCC.

Comment:

The regulation deals with safety, thus this paragraph should only refer to safety duties which are dealt with by the regulation.

Proposal:

(a) The operator shall:

(1) only assign to safety duties only cabin crew members holding a cabin crew attestation issued in accordance with PartCC.

comment 3640

comment by: FNAM (Fédération Nationale de l'Aviation Marchande)

**Comment**

As stated in EU-OPS, Subpart O, 1.989, other people, as for example: re-training or positioning flights, may be on board for duties other than safety. Moreover the requirement that only cabin crew assigned to safety duties on a flight wear the operator's cabin crew uniform is also not in on line with EU-OPS and this would create major problems within airlines. Signs as pins or badges and announcements are sufficient to comply with the distinction requirement.

comment 3771

comment by: Frank Ciupka

**Question:**

Why should a dead head crew fly in uniform on board of a foreign airline but not on board of the own company?

For passengers it's impossible to differentiate the company by uniform.

**Proposal:**

Delete **OR.OPS.210.CC** (b)(1) completely

comment 3971

comment by: CUD

Add:

(a)

(2) and having undergone aircraft type training in accordance to **OR.OPS.125.CC** for the aircraft assigned to.

Reason: **OR.OPS.125.CC (a ) (1 )** establishes a condition for the *first* assignment; the condition for assignment would be incomplete if it fails to enumerate the required type training.

comment 3972 comment by: CUD

Comment: (b) Supported.

Reason: It is vital for passengers that they in an emergency situation easily can identify cabin crew by the operator's uniform.

OR.OPS.215.CC Training courses and associated checking**

p. 21

comment 432 comment by: CAA-NL

Comment regarding:  
Following the successful completion of a training course and associated checking, the operator (..../...)

Comment CAA-NL:  
For the CAA-NL it will not be necessary to provide an updated list showing the validity of all training. This will create a lot of non essential paperwork for operators

comment 615 comment by: claire.amos

Clarification required: Is an electronic version of this acceptable? If not, there will be a significant cost impact: one additional administration head required to carry out this function.  
Question: What is the value of this list if we have a department within the company who can provide this information to individuals?

comment 758 comment by: claire.amos

Clarification required. Can this record be electronic? easyjet currently record these electronically. Should paper records be required this would be a backwards step for easyJet for no evident benefit.

comment 875 comment by: AEA

**Relevant Text:**  
Following the successful completion of a training course and associated checking, the operator shall provide each cabin crew member with an updated list showing the validity period of the related training and checking of the aircraft type(s) and variant(s) on which the cabin crew member is proficient.

**Comment:**  
This requirement is not in line with the training record keeping requirement of Subpart O of EU-OPS. This would be a huge administrative burden as updating would not be feasible, as after every-flight, the qualification would have to be extended for (6 months) the applicable period. The Basic Regulation refers to OPS 1.1005. Therefore the proposals should be realigned with EU-OPS.

**Proposal:**  
Whenever an attestation has been renewed the records should be updated.  
Use the text of EU OPS.1.1035 (3) and (4). An operator shall:  
(3) keep the training records and records of medical examinations or

*assessments up to date, showing in the case of the training records the dates and contents of the conversion, differences and recurrent training received and (4) make the records of all initial, conversion and recurrent training and checking available, on request, to the cabin crew member concerned*

 OR.OPS.250.CC Operation on more than one aircraft type or variant**

p. 22

comment 876

comment by: AEA

**Relevant Text:**

(a) Aircraft types and variants for cabin crew shall be:

(1) The types and variants determined in accordance with the applicable requirements of Part-21; and

(2) In the additional case of a cabin configuration specific to the operator, the related variant of an aircraft type shall be determined as a different type for cabin crew when not similar in location and type of portable safety equipment and in the emergency procedures.

**Comment:**

There is no legal basis for linking those cabin crew related requirements to Part-21 (Operational Suitability Certificates). In addition, type and variants for the purpose of cabin crew are not identical as type and variants for the purposes of flight crew. Therefore this should be left as an operator requirement taking into account the fact that OEMs cannot define the type and

variant for cabin crew which are the result of types of existing and the location and type of safety equipment.

We therefore urge EASA to align its requirement with EU-OPS 1.1030 (Operation on more than one type or variant).

**Proposal:**

Reference to Part 21 for the purpose of CC should be deleted. Refer to EU OPS 1.1030 text

(a) *An operator shall ensure that each cabin crew member does not operate more than three aeroplane types except that, with the approval of the Authority, the cabin crew member may operate four aeroplane types, provided that for at least two of the types:*

(1) *Non-type specific normal and emergency procedures are identical and*  
 (2) *Safety equipment and type specific normal and emergency procedures are similar*

(b) *For the purposes of subparagraph (a), variants of an aeroplane type are considered to be different types if they are not similar in all the following aspects*

(1) *Emergency exit operation;*  
 (2) *Location and type of portable safety equipment and*

"Similar" can be interpreted in many ways.

comment 2592

comment by: Deutsche Lufthansa AG

**Relevant Text:**

(a) Aircraft types and variants for cabin crew shall be:

- (1) The types and variants determined in accordance with the applicable requirements of Part-21; and
- (2) In the additional case of a cabin configuration specific to the operator, the related variant of an aircraft type shall be determined as a different type for cabin crew when not similar in location and type of portable safety equipment and in the emergency procedures.

**Comment:**

There is no legal basis for linking those cabin crew related requirements to Part-21 (Operational Suitability Certificates). In addition, type and variants for the purpose of cabin crew are not identical as type and variants for the purposes of flight crew. Therefore this should be left as an operator requirement taking into account the fact that OEMs cannot define the type and variant for cabin crew which are the result of types of existing and the location and type of safety equipment.

We therefore urge EASA to align its requirement with EU-OPS 1.1030 (Operation on more than one type or variant).

**Proposal:**

Reference to Part 21 for the purpose of CC should be deleted. Refer to EU OPS 1.1030 text

*(a) An operator shall ensure that each cabin crew member does not operate more than three aeroplane types except that, with the approval of the Authority, the cabin crew member may operate four aeroplane types, provided that for at least two of the types:*

- (1) Non-type specific normal and emergency procedures are identical and*
- (2) Safety equipment and type specific normal and emergency procedures are similar*

*(b) For the purposes of subparagraph (a), variants of an aeroplane type are considered to be different types if they are not similar in all the following aspects*

- (1) Emergency exit operation;*
- (2) Location and type of portable safety equipment and*
- (3) Type specific emergency procedures*

Add: (2) in the additional case of a cabin configuration specific to the operator, the related variant of an aircraft type shall be determined as a different type for cabin crew when not similar in the location and type of portable safety equipment, **emergency exit operation** and in the emergency procedures.

Reason: A completely different door design for opening or completely different emergency handle should be defined a different variant. This was included in OPS 1.1030.

**Original text:**

(a) The operator shall select, recruit, train and check the proficiency of the cabin crew members to be assigned to single cabin crew member operations according to criteria appropriate to this type of operations.

(b) Cabin crew members shall only be assigned to single cabin crew member operations after they:

(1) have completed the additional training course required for single cabin

crew member operations;

(2) have successfully passed the checks verifying their proficiency in performing the duties and responsibilities performed in single cabin crew member operations;

and

(3) for new entrant cabin crew members who have no previous comparable experience, have undertaken familiarization flying of at least 20 hours and 15 sectors on the aircraft type under the supervision of a suitably experienced cabin crew member.

**Suggested new text:**

(a) The operator shall select, recruit, train and check the proficiency of the cabin crew members to be assigned to single cabin crew member operations according to criteria appropriate to this type of operations.

(b) Cabin crew members shall only be assigned to single cabin crew member operations after they:

(1) have completed the additional training course required for single cabin crew member operations;

(2) have successfully passed the checks verifying their proficiency in performing the duties and responsibilities performed in single cabin crew member operations;

and

(3) for new entrant cabin crew members who have no previous comparable experience, have undertaken familiarisation flying, **for which the flying time and number of sectors is representative of the complexity of the cabin and its associated equipment and the complexity of the operations**, on the aircraft type under the supervision of a suitably experienced cabin crew member.

**Comment/suggestion:**

The complexity of the cabin and associated equipment dictate the sophistication of the required familiarization flying.

comment 3742

comment by: Christian Hölzle

This is not applicable as the TC already fulfils point 2 (medical fitness).A normal annual check shall be authorised in compliance with normal medical checks. This goes way beyond the original concept of assessment of fitness and introduces periodic assessment.This was not part of the original requirements and, unless 'periodic' is qualified, could lead to some TCM being subjected to six-monthly assessments. This clause should be removed because clause (2) and the AMC provides sufficient safety.

Unlike the original requirement, here is no limitation on the number of types that the TCM can operate on; it is not clear why there is not an equivalent rule to OR.OPS.250.CC.

comment 1282

comment by: UK CAA

**Page No: 23**

**Paragraph No:**  
OR.OPS.005.TC

**Comment:**

In Parts OPS.COM and AMC OPS.COM the term 'crew member' is used widely as befits the many various tasks and types of operations. It is considered appropriate, however, for the scope of the term 'Technical Crew Member' to be extended to cover some of these tasks such as specialist crew for helicopter under-slung load work or parachute dispatchers so that appropriate consideration is given by operators to the selection, training and use of such specialists.

JAR-OPS 4.007(a)(3) originally covered in the term 'aerial task specialists' but the reasons for not following this line fully, as explained in NPA 2009-02a at page 49, paragraph 33, are noted.

If this proposal is accepted then Part OPS.COM will require some amendment to include 'Technical Crew Members'. This would best be addressed by specialist 'Aerial Work' experts.

**Justification:**

By extending the scope of 'Technical Crew Member' to other task specialists in Commercial Operations, the training and operational requirements for such specialists will be standardised and controlled.

Delete (2)

Justification:

Medical requirements for 'technical' crew such as crew undertaking helicopter emergency medical services are not necessary. Technical crew members are defined as passengers and their incapacitation would have no impact on flight safety.

comment by: *Christophe Baumann*

This is not applicable as the TC already fulfils point 2 (medical fitness).A normal annual check shall be authorised in compliance with normal medical checks. This goes way beyond the original concept of assessment of fitness and introduces periodic assessment.This was not part of the original requirements and, unless 'periodic' is qualified, could lead to some TCM being subjected to six-monthly assessments. This clause should be removed because clause (2) and the AMC provides sufficient safety.

3801 comment by: *Swedish Transport Agency, Civil Aviation Department (Transportstyrelsen, Luftfartsavdelningen)*

**Comment:**

This paragraph is almost a copy of Annex IV 7.b.(ii) of the Basic Regulation, containing the Essential requirements for CC, but for technical crew members it has been introduced at a lower level as an Implementing Rule.

If this difference in levels has to be kept, both the IRs and AMCs proposed for CC need to be transposed to the level of AMC for technical crew members to make OR.OPS.015.TC possible to implement. A better option would be to use the same requirements for both CC and TC.

(2) and (3) should be compared to the corresponding requirements for CC in OR.OPS.110.CC. The medical requirements to be met are exactly the same, but the procedures to be used are differently described.

**Proposal:**

The medical requirements for CC in OR.OPS.110.CC and those for technical crew member in OR.OPS.015.TC should be identical.

comment by: *Pietro Barbagallo ENAC*

Comment: Change as follows: a) Initial training, including CRM relevant for their duties

Justification: To stress the importance of tailoring of CRM for this role and avoid generic and ineffective CRM. The same applies to 025.TC and 035.TC. Some specification should be made on suitably qualified personnel permitted to conduct this training and the good practice to deliver CRM in joint session with the rest of the crew.

**C. III. Draft Opinion Part-OR - Subpart OPS - Section VII - OR.OPS.030.TC**  
**Familiarisation flights**

p. 24

comment 1286 comment by: *UK CAA*

**Page No:** 24

**Paragraph No:**  
OR.OPS.030.TC

**Comment:**  
Familiarisation flight infers that the technical crewmember has only to be familiar with his/her working environment before being checked.

**Justification:**  
The term 'familiarisation flight' should be replaced with 'role training flight' to instil a level of competence in the technical crew member.

**Proposed Text (if applicable):**  
**New title:**  
Role training flight

**New sentence:**  
Following completion of type-related or conversion training, each crew member shall undertake role training before undertaking HEMS, HHO, NVIS operations or similar roles.

comment 3743 comment by: *Christian Hölzle*

Recurrent TC : Owing to the high number of checks it should be possible to combine with PPC or other related checks in accordance with the National Authority. Flight crew undergo 14 checks : HELO recency, NVIS (3 missions in 90 days), HHO (3 night hoist cycle in 90 days), HEMS (30 minutes IFR in 6 months), HEMS VMC prof check, HEMS Night prof check, HEMS line check, Recurrent training on each type, CRM annual check, OPS prof. check (check valid 6 months), Emergency and safety check (annual), Ground training (annual), Commercial OPS other than CAT (annual check), dangerous check (2 years).

Refresher training**

p. 24

comment 1572

comment by: *REGA*

To facilitate the company's internal procedures and to be able to plan more

efficient the training and checking of crew members (Flight Crew and Technical Crew Member), the period of validity should be equal for all kind of checks and crew members. REGA decided to check their crew member every 12 months for their relevant duties: After several decades of experience, REGA does not see any disadvantage in these checking periods or any negative impact regarding to flight safety. The period of validity for Operator Proficiency Check, Line Check, Emergency and Safety Checks and the according training shall be 12 months.

**Proposal (OR.OPS.040.TC Refresher training)**

*Each technical crew member who has not undertaken duties in the previous 12 months in the relevant type of aircraft shall complete refresher training relevant to the type of aircraft and equipment which the technical crew member operates.*

comment 3552

comment by: KLM Cityhopper

**Comment:**

The EASA proposal is in contradiction and more restrictive than the EU Working Time Directive (WTD) (Council Directive 2000/79/EC of 27 November) which has set a limit of 900 hours in 1 calendar year and provides for more flexibility in particular when planning crew member yearly leave.

EASA's referring to ICAO cannot be accepted as a valid justification taking into account the fact that ICAO is not setting any limit which means that most non-EU airlines can already today do much more block flying hours than EU airlines which are faced with the 900h limit.

In addition, there is no safety justification to further restrict the current WTD limit. There is already requirement to evenly distribute the duty hours,

**Proposal:**

Replace OR.OPS.040. FTL (b) (2) with 'in 1 calendar year'

**C. III. Draft Opinion Part-OR - Subpart OPS - Section VII - OR.OPS.045.TC  
Checking**

p. 24

comment 150

comment by: EHOC

General

The original text excluded checking for refresher training - this should also be excluded in this rule.

Missing subsequent rule

It is not clear why 'Training Records' has been transferred to the MLR section from the training section. Whilst it is a record of training, it is an instruction to the operator about the recording and availability of these records rather than an instruction for the storage (which is contained in the immediate section above).

It should be returned to the FC section:

"OR.OPS.050.TC Training records

The operator shall:

- (a) Maintain records of all training, checking and qualification prescribed in this Section undertaken by a crew member; and
- (b) Make the records of all conversion courses and recurrent training and checking available, on request, to the crew member concerned."

comment

1288

comment by: UK CAA

**Page No:** 24**Paragraph No:** OR.OPS.045.TC**Comment:** Recurrent checking is not addressed clearly.

**Justification:** The existing text requires 'checking on completion of training'. This could be misinterpreted for initial training only. Therefore the sentence should expand on those occasions where checking is required.

**Proposed Text (if applicable):**

(a) Following the completion of initial and recurrent training, each technical crew member shall undergo a check to demonstrate their proficiency in carrying out normal and emergency procedures.

comment

2859

comment by: Civil Aviation Authority of Norway

Following a successful checking of competence, some evidence of their proficiency should be provided to the technical crew member, and the operator should also be required to establish and maintain a training record for technical crew members.

comment

3150

comment by: DGAC

This paragraph is named "Checking", however it deals also with training.

To be consistent with OR.OPS.xxx.FC, there should be a general paragraph dealing with "training and checking". Provisions contained in AMC OR.OPS.035.TC §1 should be moved to that general paragraph and aligned with the wording of OR.OPS.145.FC §(h)

**European Regions Airline Association Comment**

Recent EASA presentations regarding options for future FTL scheme for CAT operations [RM task OPS 055] means this section remains under review. A lack of response at this time should not be interpreted as tacit acceptance of Section VIII. ERA reserves the right to come back to EASA on Section VIII once the options issue has been settled.

The ERA Directorate understand that the Agency are planning separate Rule making activity in regard to FTL and wish to re-iterate that the Directorate would welcome Industry participation in providing 'expert' input.

comment 3188

comment by: Virgin Atlantic Airways

**Relevant Text:**

Entire CS FTL section

**Comment:**

Content of this entire section appears entirely geared to cover short/medium haul commercial operations and there are a variety of topics addressed in EU-OPS Part Q that have been omitted. These include:

Extended FDP (split duty) (Subpart Q - OPS 1.1105 point 6)  
 Extension of flight duty period due to in-flight rest (Subpart Q - OPS1.1115)  
 Standby (this includes other options above and beyond the Aerodrome/operating site standby addressed by EASA in OR.OPS.050.FTL) (Subpart Q - OPS1.1125)

Also in the absence of any information regarding the FTL Rulemaking Task there is no information on how variations to FTL schemes would be managed (this is also covered in EU Ops Subpart Q and subject to the provisions of Article 8)

Without this information and based solely on what is currently included in EASA NPA 2009-02c Subpart OPS - Section VIII - CS FTL, Virgin Atlantic would be unable to continue operating a number of existing services due to FDP limitations. This is completely unacceptable to Virgin Atlantic since it would have significant operational and cost impact for no safety justification.

**Proposal:**

Amend CS FTL Section to include all content from EU-OPS Part Q. In particular:

Extended FDP (split duty) (Subpart Q - OPS 1.1105 point 6)  
 Extension of flight duty period due to in-flight rest (Subpart Q - OPS1.1115)  
 Standby (Subpart Q - OPS1.1125)

Provide clarification on content of FTL rulemaking task and how variations in FTL schemes will be managed (subject to provisions of Article 8)

Last Feb. I was attending a FRMS training course at the NTSB, USA with Dr. Mark Rosekind, PhD. He said that it is very important to develop an "alertness strategy". I would suggest to add it to the scope.

comment 409 comment by: *Rega / Swiss Air-Ambulance*

**OR.OPS.005.FTL Scope****Preface:**

It is the opinion of Rega, Swiss Air Ambulance that it is very wise to distinguish between Implementing Rules (IR) and Guidance Material (GM) like for example the Certification Specifications CS.FTL 1. This allows e.g. dedicated Aeroplane Emergency Medical Service (AEMS) operators to develop together with EASA refined FTL's adapted for the specific requirements of the stakeholder. Putting everything into Implementing Rules (IR) would impede a process of refining Guidance Material (GM) for the benefit of the stakeholders.

**Scope:**

FTL's developed for e.g. major airline operators and fixed in Implementing Rules (IR) would jeopardize the ability for dedicated Aeroplane Emergency Medical Service (AEMS) operators to hurry and MEDEVAC sick/wounded patients in need in due time for treatment.

**Text to be added/altered:**

**NIL; keep the differentiation between Implementing Rules (IR) and Guidance Material (GM) (e.g. CS FTL) like proposed in the published EASA-OPS NPA.**

**Proof:**

N/A

**Background:**

Swiss Air Ambulance is a subsidiary of Rega, Switzerland's national air-rescue organisation, which was founded in 1952. Swiss Air Ambulance can draw on decades of experience and the expertise of professional teams to provide competent, comprehensive assistance in the event of medical emergencies all over the world operating besides 13 dedicated HEMS helicopters 3 dedicated Bombardier CL-604 "Challenger" ambulance jets with a range of 3'500 NM. Its services range from providing medical advice to repatriating patients to/from Switzerland or any other point of the world. Swiss air-ambulance is a private, non-profit organisation, which operates in accordance with the guiding principles of the Red Cross. It comes to the aid of people in distress, without respect of their nationality, religious conceptions or social status. Swiss air-ambulance operates under the Air Operator Certificate CH-AOC-No.1015 issued by the Federal Office of Civil Aviation Switzerland (FOCA) and is compliant with EU-OPS. **C. III. Draft Opinion Part-OR - Subpart OPS - Section VIII - Chapter 1 - OR.OPS.010.FTL Definitions**

p. 24-25

comment 2 comment by: *AIR SAFETY GROUP*

The Definitions in any sophisticated FTL Scheme form the key to success of the scheme ensuring its clarity and unambiguous interpretation throughout. No phrase or word should be used within the FTL scheme that may hold different meanings to different people and any such phrase/word must be defined to avoid any possibility of misinterpretation, either inadvertent or deliberate, in day to day usage.

**DEFINITIONS**

Should not include examples (unless it contains all possible examples) because in day to day operations if the example that applies is not given, there will be a difference of opinion and it should not be open to subjective judgements of individuals.

**(a) AUGMENTED FLIGHT CREW.** - Agree this definition but should there not also be a definition relating to Augmented Cabin Crew?

DUTY definition should be precise and as follows: -

**(c) "DUTY means any continuous period during which a crew member is required to carry out any task associated with the business of an Aircraft Operator."**

If examples have to be included then suggest the following addition: -

**"It includes, but is not limited to, flight duty, administrative work and other ground duties, training, positioning and standby."**

Is a meeting to have a new uniform fitted, renew a medical, attend a disciplinary hearing etc a 'Duty'? This would be covered by 'other ground duties' above.

The phrase 'when it is likely to induce fatigue' following 'standby' is meaningless, as everything one does whilst awake can be assumed to be contributing to the gradual build up of fatigue, so it becomes a matter of subjective assessment and, whilst an individual crew member may claim standby has induced fatigue, the operator may well think otherwise. So, whose opinion counts? In the definition proposed above Standby is a task which places restraints upon a crew member and is a requirement associated with the business of the Aircraft Operator and, as such, is undoubtedly a Duty.

**(g) HOME BASE** - suggest add at the end of this definition **"and where accommodation is the responsibility of the individual crew member"**.

**(i) LOCAL NIGHT** - suggest change to reflect the proposal in the Moebus Aviation Scientific Review.

**(j) A SINGLE DAY FREE OF DUTY** - suggest this be re-labeled as: -

**DAYS OFF means time free from all duties. A single Day Off shall include two local nights. Consecutive Days Off shall include a further local night for each additional consecutive Day Off. A rest period may be included as part of a Day Off.**

**(k) Operating Crew Member means a flight crew, cabin crew or technical crew member who carries out their duties in an aircraft during flight.** Note: Enlarging on this definition effectively provides a definition for Crew Member as well.

**(l) Positioning** - Insertion of the comma after the first vice versa makes this definition ambiguous. Presumably Positioning is classed as a duty, but is the 'time for local transfer from place of rest to the commencement of duty and vice versa' also classed as duty or is this intended to be excluded as a duty? Including the comma tends to imply or infer that the local transfer time is classed as positioning.

I would agree that normal travel time from crew member's Home to their designated **'HOME BASE'** (as opposed to a **'designated reporting point'**, which is not defined and could be anywhere and many hours away) is not to be classed as duty. I would also agree that travel time for local transfer from place of rest to commencement of duty **'when away from Home Base'** should also not be classed as Duty. Deletion of the aforementioned comma would clarify this point, if indeed that is what is intended! Suggest the

following: -

**(I) Positioning means the transferring of a non operating crew member from place to place at the behest of the operator. It excludes both the travel time from home to the designated home base and vice versa and, for both operating and non operating crew members when away from home base, the travel time for local transfer from a place of rest to the commencement of duty and vice versa.**

**General Comments relating to Definitions: -**

There are a number of words and phrases used within the FTL scheme which are not defined. There are also common day to day practices that occur that should also be defined for clarity and to complete the gaps in the scheme. Suggest definitions be inserted for the following: -

1. **Acclimatised - W hen a c rew member h as s pent 3 consecutive local nights on the ground within a time zone which is 2 hours wide, and is able to take uninterrupted nights sleep. The crew member will remain acclimatised thereafter until a duty period finishes at a place where local time differs by more than 2 hours from that at the point of departure.** Note: Whilst the WOCL definition suggests a form of acclimatisation, it is not specific enough. The FTL scheme must limit the FDP permitted to crew members on the day who are not acclimatised to local time and there must, therefore, be a definition of how and when a crew member becomes acclimatised.
2. **Contactable means a short period of time of no more than 2 hours during the day, other than on a Day Off, during which the Operator requires a crew member to be at an agreed location for the purpose of giving notification of a duty period which will commence not less than 10 hours ahead. The 2 hour Contactable time period shall be specified by the Operator.** Note: Having this facility provides flexibility for the Operator to arrange or re-arrange the roster when delays occur and allows the crew member to receive adequate notice of a change that will then permit sufficient rest prior to the notified duty. Days Off however remain sacrosanct and should not be disturbed.
3. **Early Start Duty means a duty that commences within the period 06.00 to 06.59 hours.** Note: A start earlier than 06.00 will fall within the WOCL. Consecutive early starts should be limited in number to 3 and no more than 4 in any 7 consecutive days, as it leads to sleep deprivation and fatigue.
4. **Late Finish Duty means a duty that ends in the period 01.00 to 01.59 hours.** Note: Consecutive Late Finish Duties should also be limited to 3 and no more than 4 in any consecutive 7 days. As with consecutive early starts, consecutive Late Finish Duties can lead to sleep deprivation.
5. **Night Duty means a duty that impinges upon the Window of Circadian Low.** Note: Consecutive Night duties should be limited to 3 with no more than 4 in any consecutive 7 days. Additional rest should also be included both prior to and subsequent to consecutive Early, Late and Night duties to aid recovery from such duties prior to resuming the next duty. Where specific arrangements are approved for up to five consecutive such duties, compensating factors must be included to alleviate the impact. This may include additional Days Off, reduced overall cumulative Flying Hours and/or reduced cumulative Duty Hours

- within any consecutive 28 days together with reduced FDP on the day.
6. **Reporting Time means the time at which a crew member is required to report for any Duty.** Note: Realistic reporting times prior to a flight, which may vary between different bases and/or aircraft operations, must be included in the Operator's Operations Manual and must be based on actual custom and practice and the realistic time it takes for all necessary pre-flight planning. The times listed must not place undue pressure on crews to rush this important task. Crew members reporting at Home Base invariably arrive early simply to ensure they are not late for the flight.
  7. **Sector means the time between an aircraft first moving under its own power until it next comes to rest, after landing, on the designated parking position.** Note: This definition is required because it ties in with another proposed definition of **Split Duty** in relation to extending the FDP by taking "periods off duty on ground during a single FDP". It must be made clear that Split Duty is on a **pre-planned** basis between two **Sectors** (as opposed to between two duties because of an unforeseen delay).
  8. **Split Duty means an FDP which consists of two sectors, separated by less than a minimum rest period.** Note: If the split is permitted between two duties, then it will be used whenever a delay occurs in the daily operation such that anything up to 8 or 9 hours or more 'break' will then add 50% of that time in order to extend the FDP leading to potentially excessive amounts of time on duty (anything up to 17 or 18 hours).
  9. **Break means a period of time free of duty between two sectors that is less than the minimum rest period.** Note: Again, this definition is required to complete the picture in terms of Sector and Split Duty definitions.
  10. **Suitable Accommodation means a well furnished bedroom which is subject to minimum noise, is well ventilated, and has the facility to control the levels of light and temperature.** Note: There must be a requirement incorporated within Subpart Q for Operators to provide suitable accommodation for all crew members after an FDP, when they are operating away from their Home Base. If no such requirement exists, crew members may be required to sleep in the aircraft or crew room and this is unacceptable.
  11. **Scheduled Seasonal Period.** Note: Used in OR.OPS.015FTL para(l) and is somewhat meaningless in that generally the recognised seasons tend to merge into each other in modern aviation operations. This can mean a number of things to different people and cultures and, because it is used in this paragraph, then it should be defined so that its use is unambiguous and clear.

comment by: Rega / Swiss Air-Ambulance

**OR.OPS.010.FTL Definitions (m)****Scope:**

Rephrase the term "Rest Period" to "Rest Time" and add the new defined term "Rest Period".

**Text to be added/altered:**

(m) **"Rest Time"** means the continuous and defined period of time, subsequent to and/or prior to duty, during a crew member is free of all duties;

**(n) " Rest Period" means an extended recovery rest period to compensate for cumulative fatigue;**

**(o)** "Standby" means ... rest of text no change

**(p)** "WOCL" means ... rest of text no change

**Proof:**

The terms "Rest Time" and "Rest Period" are under EU-OPS well established and understood in the aviation community. It makes no sense to alter this well known terms; there is no gain in safety.

For Swiss Air Ambulance it is economically unbearable to alter and adapt all the computer programs assisting the operations for no reason with the from EASA proposed terms.

**Background:**

Swiss Air Ambulance is a subsidiary of Rega, Switzerland's national air-rescue organisation, which was founded in 1952. Swiss Air Ambulance can draw on decades of experience and the expertise of professional teams to provide competent, comprehensive assistance in the event of medical emergencies all over the world operating besides 13 dedicated HEMS helicopters 3 dedicated Bombardier CL-604 "Challenger" ambulance jets with a range of 3'500 NM. Its services range from providing medical advice to repatriating patients to/from Switzerland or any other point of the world. comment by: *Rega / Swiss Air-Ambulance*

**OR.OPS.010.FTL Definitions**

**Scope:**

The under EU-OPS and JAR-OPS/JAR-FCL well understood and separated definitions "Flight Time" and "Block Time" shall be maintained. Alter the definition of "Flight Time" to "Block Time" while introducing the definition "Flight Time" with a new wording.

**Text to be added/altered:**

**(b) "Block Time" means:**

(1) for aeroplanes ... rest of text no change

(2) for helicopters ... rest of text no change

(3) for sailplanes ... rest of text no change

(4) for balloons ... rest of text no change

**(f) "Flight Time" means the time an aircraft is airborne for the purpose of flight**

**(g)** "Flight Duty Period (FDP)" ... rest of text no change

**(h)** "Home base" ... rest of text no change

**(i)** "Local day" ... rest of text no change

**(j)** "Local" ... rest of text no change

**(k)** "A single day free of duty" ... rest of text no change

**(l)** "Operating crew member" ... rest of text no change

- (m) "Positioning" ... rest of text no change
- (n) "Rest Period" ... rest of text no change
- (o) "Standby" ... rest of text no change
- (p) "Window of Circadian Low (WOCL)" ... rest of text no change

**Proof:**

- The aviation industrie needs to be able to differentiate between two definitions of time. The "Block Time" is used for e.g. pilots log book entries, for entries in the "flight and duty time reports", for entries in NAA's proficiency and skill test forms and so on. On the other hand the definition "Flight Time" is to be used in connection with entries in the aircraft's technical log book/flight log/journey log
- It is economically not bearable for Swiss Air Ambulance to alter and reprogram numerous IT-applications to comply with the proposed new definition of "Flight time" as per NPA OR.OPS.010.FTL Definitions
- Using new the definition "Flight Time" instead of "Block Time" leads to confusion within the aviation community

**Background:**

Swiss Air Ambulance is a subsidiary of Rega, Switzerland's national air-rescue organisation, which was founded in 1952. Swiss Air Ambulance can draw on decades of experience and the expertise of professional teams to provide competent, comprehensive assistance in the event of medical emergencies all over the world operating besides 13 dedicated HEMS helicopters 3 dedicated Bombardier CL-604 "Challenger" ambulance jets with a range of 3'500 NM. Its services range from providing medical advice to repatriating patients to/from Switzerland or any other point of the world. Swiss air-ambulance is a private, non-profit organisation, which operates in accordance with the guiding principles of the Red Cross. It comes to the aid of people in distress, without respect of their nationality, religious convections or social status. Swiss air-ambulance operates under the Air Operator Certificate CH-AOC-No.1015 issued by the Federal Office of Civil Aviation Switzerland (FOCA) and is compliant with EU-OPS. Comment on OR.OPS.010.FTL(b)(1): change as follows:

(b) 'Flight time' means:

(1) for aeroplanes and touring motor gliders the total time from the moment the aircraft first moves from its parking **place position** for the purpose of taking off until the moment it finally comes to rest on the designated parking position at the end of the flight and all engines or propellers are stopped;

Justification:

To remain consistent with the end of the sentence, we should use the same word.

comment

Comment on OR.OPS.010.FTL:

Editorial recommendation:

- Definitions should appear in alphabetical order.

comment 204 comment by: *Eurowings Luftverkehrs AG*

"At the end of the flight": this specification is added to the current definition of "flight time" in EU-OPS. The sense of this is not understandable and leaves following unclear. Excluded are cases where an aircraft moves from the parking position for the purpose of taking off, but because of an unexpected event has to taxi back to the parking position without taking off, resulting in a cancellation of the flight. This means to be end of the flight time as well, also without any end of any flight.

comment 205 comment by: *Eurowings Luftverkehrs AG*

EU-OPS stated, whether and to what extent standby is to be accounted for as duty has to be defined by the authority. The new definition is very likely to create a lot of confusion in applying the rule. What is likely to induce fatigue is very flexible, unclear and individually different. It depends on the context of the whole duty roster, duties and rest times before. There has to be a clear statement what kind of standby is duty, this has to be implemented in an undisputable way into the CMS. Any ambiguous definitions are very likely to produce irritations between Crewmembers and Operators and may by this cause an unstable operation

comment 206 comment by: *Eurowings Luftverkehrs AG*

The clear statement of the EASA during the Meeting in Cologne on 11.03.2009 was, that no changes to the rules of Subpart Q where made. This new definition now expands the FDP to all duties before or in between on-duty-flights with the result, that FDP-regulations are significantly extended. Split-Duties and Duties that contain a break will be made impossible. This will lead to a obvious increase of staff demand, especially in times of holidays with reduced flight schedule, where breaks become necessary. Economic effects may be high.

The distinction between a non-flight-duty before or within any flights to be accounted as FDP to a non-flight-duty after a the last leg not to be FDP is not comprehensible and makes no sense.

comment 208 comment by: *Eurowings Luftverkehrs AG*

This definition is superfluous, as the term "single day free of duty" is not used within the rules and limitations. Instead it already now brings a lot of confusion within EU-OPS leading to misunderstandings concerning demands and claims for 2 local nights whenever a single day off is planned. A clearer legal provision would be appreciated!

comment 253 comment by: *ECA - European Cockpit Association*

Comment on OR.OPS.010.FTL(g): Reintroduce EU OPS wording as follows:  
(g) 'Home base' means the location nominated by the operator to the crew member from where the crew member normally starts and ends a duty period or a series of duty periods **and where, under normal conditions, the operator is not responsible for the accommodation of the crew**

**member concerned;**

## Justification:

The accommodation part disappeared and could lead operators to move crews too easily around. This could lead operators to implement reduced rest at home base without crew accommodation provided by the operators; this situation would introduce an additional fatigue factor, due to less time to get sleep.

Implications with taxes and social charges.

OR Ops 035 TC

Annual recurrent training for TC

Due to the high number of checks it shall be possible to combined with PPC or other related checks in accordance with the National Authority. Flight crew undergo 14 checks : HELO recency, NVIS (3 missions in 90 days), HHO (3 night hoist cycle in 90 days), HEMS (30 minutes IFR in 6 months), HEMS VMC prof check, HEMS Night prof check, HEMS line check, Recurrent training on each type, CRM annual check, OPS prof. check (check valid 6 months), Emergency and safety check (annual), Ground training (annual), Commercial OPS other than CAT (annual check), dangerous check (2 years).

comment 369

comment by: *Reto Ruesch*

OR Ops 010 FTL

Definition b) Flight time

The flight time definition is in Switzerland defined as rotor turning time by the National authority.

comment 389

comment by: *Ryanair***OR.OPS.010.FTL (b)****Comment**

Use of the term 'flight time' in the context of FTLs conflicts with the term 'flight time' that is used for Engineering records.

**Proposal**

Change the word 'flight time' to 'block time'

comment 390

comment by: *Ryanair***OR.OPS.010.FTL (e)****Comment**

The definition of 'flight crew member' could include training/checking personnel not required as part of the minimum crew complement

**Proposal**

Flight crew member means a pilot, flight engineer or flight navigator required as part of the minimum crew complement and assigned to duty in an aircraft

**OR.OPS.010.FTL (j)**

**Comment**

The definition of a 'single day free of duty' could be misinterpreted as a 24 hour period starting at 00.00 followed by an additional two local nights

**Proposal**

Revert to EU OPS definition "a single day free of duty shall include 2 local nights. A rest period may be included as part of the day off"

**OR.OPS.010.FTL (m)****Comment**

On the basis of the revised definition of a duty in (c) and the addition of the requirement "subsequent to and/or prior to duty" would mean that all persons subject to the FTL would require minimum rest before non-safety related administrative duties

**Proposal**

"Rest period" means a continuous and defined period of time, subsequent to and/or prior to flight duty or standby duty during which a crew member is free of all duties"

**OR.OPS.010.FTL (o)****Comment**

The definition of the WOCL takes no account of fatigue mitigating roster principles such as consecutive early starts, no overnights, fixed days off. On the basis of scientific analysis, operational experience and in the interest of safety Operators must be allowed to permanently adjust the penalties associated with the WOCL by +/- 60 minutes to take account of operator specific requirements.

**Proposal**

Window of Circadian Low (WOCL) means the period between 02.00 and 05.59 hours local time. Within a band of 3 time zones the WOCL refers to home local base time. Beyond 3 time zones the WOCL refers to home base local time for the first 48 hours after departure from home base time zone and to local time thereafter. Operators may, on the basis of scientific analysis, operational experience and with the agreement of the Competent Authority, permanently move the penalties associated with the WOCL Band by +/- 60 minutes.

*Operator approved* to be added prior to every reference to the WOCL

**Proposed new definition – OR.OPS.010.FTL (p) – Split Duty**

Split Duty is an FDP consisting of two or more sectors but separated by less than a minimum rest period.

comment

comment by: *Ryanair***Comment**

There is no definition of cabin crew member

**Proposal**

(p) 'Cabin Crew Member' - a member of the crew who carries out his/her duties in the aircraft cabin during a flight

comment

455

comment by: *Condor Flugdienst GmbH - FRA HO/R***Flight Time:**

According to Condor Flugdienst GmbH the definition for "flight time" seems to address "block time" instead. (Please compare EU OPS, Subp. Q, OPS 1.1095). Flighttime should be defined as follows: "For aeroplanes (...) the time from lift off of the last part (tire) from ground to touch down (first ground contact of any aircraft part).

**Duty:**

This para needs clarification as far as standby duties are concerned. Here we need clarification that "standby duty" only regards aerodrome/operating site standby!

**A single day free of duty:**

This definition should be deleted as this is not referenced in this NPA.

**Positioning:**

Compared to EU OPS, Subpart Q the definition of "travelling time" is missing.

**WOCL:**

The term "after departure" in the last sentence can be misleading. It should be stressed that "after departure" shall be interpreted as the beginning of the last duty referenced to homebase`s time zone.

comment

comment by: *RAF-AVIA Airlines**Place of rest away from home base.*

*Place of rest away from home base is a place where the crew members normally end and start from a duty period and where suitable accommodation is provided. The operator is responsible for provision of the place of rest away from home base (suitable accommodation) for the crew members concerned.*

*Suitable accommodation in place of rest away from home base.*

*Suitable accommodation is a suitably furnished bedroom, which is subject to minimum noise, well ventilated and has the facility to control the levels of light and temperature.*

comment

622

comment by: *easyjet safety*

(b) (1)

Comment: The definition of "Flight Time" in respect of (b) (1) lacks clarity.  
Proposal: Change "Flight Time " to "Block time" and delete "at the end of the flight" thereby removing the assumption that the aircraft has to leave the ground.

comment

623

comment by: *easyjet safety*

(c) Comment: "standby when it is likely to induce fatigue" is imprecise. All Airport Standby will induce fatigue and all home standby imposes restraints that will induce stress and therefore fatigue.

Proposal: Delete "when it is likely to induce fatigue." Add new sentence. "The extent to which standby is accountable for Flight Time Limitation controls must be defined within an operators flight time specification scheme."

comment 624

comment by: *easyjet safety*

Comment: There is no definition of "Cabin Crew member."

Proposal: " A person employed to facilitate the safety of passengers whose duties are detailed by the operator or aircraft Commander. Such persons will not act as a member of the flight crew."

Comment: There is no definition of "Crew Member"

Proposal: " A member of the flight crew or cabin crew."

comment 625

comment by: *easyjet safety*

(f)

Comment: FDP should only apply to operating crew members.

Proposal: amend to read: " a period during which a crew member operates in an aircraft and which commences....." and " at the end of the last flight on which they are an operating crew member."

comment 626

comment by: *easyjet safety*

(g)

Comment: Requires further clarification.

Proposal: Add " and where under normal conditions the operator is not responsible for providing accommodation for the crew member."

comment 627

comment by: *easyjet safety*

j)

Comment: Requires further clarification

Proposal: Change to read: "Time available for rest and relaxation free from all duties. A single day free from duty shall include two local nights. Consecutive days off shall include a further local night for each additional consecutive day off. A rest period may be included as part of a day off."

comment 628

comment by: *easyjet safety*

(o)

Comment: Creates undue complexity and fails to take into account the influence of local time zeitbergers.

Proposal: Amend to read: " Within a band of three time zones the WOCL refers to local time at the place of report."

comment 717

comment by: *Luftfahrt-Bundesamt*

The LBA does not agree to move EU-OPS in a CS, due to its legal uncertainty,

even when the Basic Regulation asks for a CS.

We herewith request to establish a clear legal situation by keeping the FTL – Requirements in the Implementing Rules.

The FTL rules as proposed do not include requirements for corporate operations with non-complex motor powered aircraft. This is not acceptable as pilots of these aircraft deserve the same protection against fatigue as their colleagues in larger aircraft.

Justification: see LBA - General Comment, reasons 1 and 2

comment 849

comment by: Jill Pelan

#### **OR OPS 010 FTL DEFINITIONS**

(a) "Augmented flight crew means....."

**Amended text proposed** : 'Augmented cabin crew' means a cabin crew complement which comprises more than the minimum number required to operate the aircraft and within which each fully qualified cabin crew member can leave their assigned post and be replaced by another appropriately qualified cabin crew member for the purpose of in-flight break;

**JUSTIFICATION** : When operating flights with in-flight break the minimum cabin crew should be on duty in order to attend in-flight emergencies appropriately.

(c) 'Duty' means any task that a crew member is required by the operator to perform, including, for example, flight duty, administrative work, training, positioning, and ~~standby when it is likely to induce fatigue;~~

**Replace: airport standby and all other forms of standby**

**JUSTIFICATION** : BR 216/2008 establishes in Art. 22 2.(a) that Initially, the implementing rules shall include all substantive provisions of Subpart Q of Annex III to Regulation (EEC) No 3922/91. In order to meet this essential requirement provisions of Subpart Q OPS 1.1125 should be taken into account. The mentioned OPS reads:

1.2. Airport standby will count in full for the purposes of cumulative duty hours.

1.3. Where airport standby is immediately followed by a flight duty, the relationship between such airport standby and the assigned flight duty shall be defined by the Authority. In such a case, airport standby shall be added to the duty period referred to in OPS 1.1110 under points 1.1 and 1.2 for the purposes of calculating minimum rest.

1.4. Where the airport standby does not lead to assignment on a flight duty, it shall be followed at least by a rest period as regulated by the Authority.

**Leading to the conclusion that airport standby needs be followed by minimum rest because it generates fatigue.**

**Request:** AMC or GM is needed to define whether standby other than airport standby generates fatigue or not. Further scientific is needed. The MOEBUS study could not establish criteria to what extent standby has to taken into account when counting cumulative duty hours. This is needed in order to meet the ER that establishes that the latest scientific and technical evidence shall be taken into account when proposing new FTL IR.

(f) 'Flight Duty Period (FDP)' means a period which commences when a crew member is required to report for duty that includes a flight or a series of flights and which finishes when the aircraft finally comes to rest and the engines are shut down or the rotor blades are stopped, at the end of the last flight on

which they are a crew member;

**TEXT Replacement:** after the aircraft finally comes to rest and the engines are shut down or the rotor blades are stopped allowing for safety and security related tasks to be completed, at the end of the last flight on which they are a crew member and When all passengers have disembarked on commercial operations and crew duties and checks have been completed as required by the authorities and operators.

**Justification & Reason:** Even after the engines have been shut down, i.e. during disembarkation, it could become necessary to initiate an evacuation. FDP and its limitations are designed to make sure that crew members are alert to do so. All safety related tasks should be carried out during the FDP.

(g) **"Home base"** means the location nominated by the operator to the crew member from where the crew member normally starts & ends a duty period or series of duty periods

**Replace with the addition :** " and where the operator does not provide rest accommodation"

**Reason & JUSTIFICATION :** If left as such the operator may consider "home base" as a lay over with rest accommodation & use minimum rest periods as in Section VIII "Flight and Duty time limitations and rest requirements" CS FTL 1.155 (b). This has been suggested by the French authorities....

(i) 'Local night' means a period of eight hours falling between 22:00 hours and 08:00 hours local time;

**Replace:** ten hours falling between 22:00 hours and 10:00

**Reason:** The term 'local night' is used in the IR to establish a weekly rest period which is clearly intended to mitigate the effect of cumulative fatigue. The MOEBUS study indicates in the answer to question 10 that there is scientific evidence that shows that the effectiveness of the second night sleep (see OR.OPS.355.FTL (d) and CS FTL.1.155 (c)) is limited if the second night is followed by a duty period starting as early as 06:00.

(l) 'Positioning' means the transferring of a non-operating crew member from place to place, at the behest of the operator, excluding the time from home to a designated reporting place\* and vice versa, or time for local transfer from a place of rest to the commencement of duty and vice versa;

**\*Replace by** " designated Home base" as defined by (g) in the definitions

**Reason :** If the "designated reporting place" is not the "home base" then "a place of rest" must be provided as in the latter part of this definition .

**Replace:** time, limited to one hour for local transfer from a place of rest to the commencement of duty and vice versa

**Reason:** The place of rest away from home base is chosen by the operator, if for any reason the operator chooses a place further away than a one hour transfer from the reporting point, the transfer time should be counted as FDP as it generates fatigue.

**OR.OPS.015.FTL Operator responsibilities**

(a) publish duty rosters sufficiently in advance to provide the opportunity for crew members to plan adequate rest;

**Request:** What does sufficiently mean? CS should establish what sufficiently in advance means in days.

**Reason & JUSTIFICATION :** Not knowing when a crew member will be scheduled for a duty in advance is stressful and fatigue generating. Issuing CS that establish a minimum advance allow for enough flexibility for any kind of operation.

(e) take into account the relationship between the frequencies and pattern of flight duty periods and rest periods and give consideration to the cumulative effects of undertaking long duty hours combined with minimum rest periods;

**Insert at the beginning:** "*when scheduling,*"

**Reason:** In order to generate a legal obligation of a precise action that shall follow the *taking into account*, this action *scheduling*, should be mentioned for more clarity.

**Request:** AMC and GM should give guidance on how this should be taken into account when scheduling.

(f) allocate duty patterns which avoid practices that cause a serious disruption of established sleep/work pattern such as alternating day/night duties;

**Supported, but the term day and night duties should be defined (see UK CAP 371).**

**Request:** AMC and GM should take up the recommendation made by MOEBUS in the answer to question 4; reporting times should not be advanced on consecutive days.

**Reason:** Sleep deprivation, especially in the WOCL, has a detrimental effect on alertness.

(h) plan local days free of duty and notify crew members sufficiently in advance;

**Request:** The advance needs to be defined in CS or AMC.

**Reason:** See reason to OR.OPS.015.FTL (a)

~~(i) provide a meal and drink opportunity in order to avoid any detriment to a crew member's performance, especially when the Flight Duty Period (FDP) exceeds six hours;~~

**Replace:** provide a 20 minute meal break for any six hours Flight Duty Period (FDP) with an additional 10 minute break for any three hours of FDP that do not contain a meal break in order to avoid any detriment to a crew member's performance;

**Reason:** **Hypoglycaemia** and hypo hydration are likely to occur on long duty hours and will result in increased fatigue, loss of concentration and detrimental to alertness.

(l) take action to change a schedule or crewing arrangements where the actual operation exceeds the maximum flight duty period on a significant proportion of flights in that schedule during a scheduled seasonal period.

**Replace:** arrangements, the latest  
33%

**Reason:** See Art. 22 2. (a) of BR Initially, the implementing rules shall include all substantive provisions of Subpart Q of Annex III to Regulation (EEC) No 3922/91. The 33% rule should be considered a substantive provision of Subpart Q. OPS 1.1105 4. Operational Robustness 4.1. Planned schedules must allow for flights to be completed within the maximum permitted flight duty period. To assist in achieving this operators will take action to change a schedule or crewing arrangements at the latest where the actual operation exceeds the maximum FDP on more than 33% of the flights in that schedule during a scheduled seasonal period.

The proposed text in the NPA is less restrictive; the article in Subpart Q establishes an obligation and a recommendation. The operator must correct after concluding the season, but it reads *the latest*, the operator should do this before the end of the season.

#### **OR.OPS.025.FTL Fatigue Risk Management System (FRMS)**

(d) The operator shall require that crew members report any instance if they are fatigued and that safety may be affected.

**Comment:** This puts too much responsibility on individuals. The identity of reporting individuals must be protected.

**Replace & add:** crew members have the right to refuse flight duty when suffering from fatigue of such a nature that they feel they may not be able to safely continue duties. This should not be contested by operators or authorities.

**Reason :** ICAO Annexe 6- 2.3.2. "an important safeguard may be established if states and operators recognise the right of a crew member to refuse further flight duty when suffering from fatigue of such a nature as to adversely affect the safety of flight"

French legislation : Decree of 11 July 1991 relative to fatigue of crew members:

"A crew member must abstain from duty if she/he feels any type of deficiency that leads Him/her to believe that she/he may not have the necessary aptitude to exercise his/her duties".

#### **OR.OPS.035.FTL Flight Duty Period (FDP)**

(b) The operator shall require that the pilot-in-command submit a report whenever a FDP is increased by their discretion, or when a rest period is reduced in actual operation.

Where the increase of a FDP or a reduction of a rest period exceeds one hour, the operator shall send a copy of the report, together with its comments, to the competent authority, no later than 28 days after the event.

**Replace:** "discretion, and after consultation with the crew members affected"

**Add at the end:** A copy of this report shall be made available to all affected crew members

**Reason:** The consultation process enshrined in hard law in point (a) of the same OPS and recommended in the related CS should be mandatory and not only a CS to provide legal certainty and therefore a level playing field for all operators and NAAs.

As a principle and to guarantee transparency all affected crew members should be aware of the reasons given by the pilot-in-command when increasing the FDP or reducing rest on their discretion.

#### **OR.OPS.040.FTL Flight times and duty periods**

~~(a) The total duty periods to which a crew member is assigned, spread as evenly as practicable throughout their respective period:~~

~~(1) in any seven consecutive days; and~~

~~(2) in any 28 consecutive days;~~

~~(b) The total flight time of the flights on which an individual crew member is assigned as an operating crew member, spread as evenly as practicable throughout their respective period:~~

~~(1) in any 28 consecutive days; and~~

~~(2) in any 12 consecutive calendar months.~~

**Replace with :** (a) The total duty periods to which a crew member is assigned, spread as evenly as possible throughout their respective period:

**(1) 60 hours in any seven consecutive days; and**

**(2) 180 hours in any 28 consecutive days;**

**(b) The total flight time of the flights on which an individual crew member is assigned as an operating crew member, spread as evenly as possible throughout their respective period:**

**(1) 100 hours in any 28 consecutive days; and**

**(2) 900 hours in any 12 consecutive calendar months.**

**Reason:** The word practicable leads to the conclusion that this only should be done where no additional cost is generated. The present OPS is intended to avoid cumulative fatigue and increase flight safety. Operators should be encouraged to do everything possible within their operational limits to comply with this.

**Art. 22 2. (a) BR** establishes that substantive provisions of Subpart Q should be included in IR. The total amount of duty and flight hours must be considered a substantive provision.

With regard to the proposed (a)(2), The MOEBUS study suggests in the answer to question 1 that there is not enough scientific evidence to support precise values, further scientific studies should be undertaken to recommend a precise value. In the meanwhile the recommendation of 180 hours should be followed.

#### **OR.OPS.050.FTL Standby duty**

**(a) Aerodrome / Operating standby duty shall count in full for the purpose of cumulative duty hours**

**Request :** Standby duty whether on aerodrome or elsewhere should count for 1/2 of FDP

**Reason :** It is not reasonable to expect crew to maintain high levels of

**vigilance on a long flight after 6/7 hrs of standby.**

( c ) Aerodrome/Operating standby duty which does not lead to an assignment of flight duty shall be followed by a designated rest period

**Request : Home or hotel standby duty should also be followed by a designated rest period**

**Reason : Hotel standby may otherwise be followed by a long haul flight without adequate rest.**

(d) Crew members on aerodrome/operating site standby duty shall be provided with a quiet and comfortable place not accessible to the public.

**Request: AMC or G M should recommend what is to be considered "comfortable".**

**General limitations for standby other than airport standbys should be mentioned in OR.OPS.050FTL.**

**OR.OPS.320.FTL Records of flight and duty times and rest periods**

Commercial operators shall ~~maintain~~ individual records related to the employment of all crew members regarding their flight and duty times and rest periods as follows:

(a) Flight, duty and rest period records, including, for a period of 15 months:

(1) flight times;

(2) start, duration and end of each duty or Flight Duty Period; and

(3) rest periods and days free of all duties;

(b) Reports by the pilot-in-command on extended flight duty periods, extended flight hours and reduced rest periods, for a period of six months.

**Replace:" maintain and make accessible to the crew member on request"**

**Insert: (a) (4) time spent on standby duty**

**Reason: To provide legal certainty regulated individuals should have access to any record of their duty and flight hours. As standby counts for cumulative duty hours it should be recorded.**

**OR.OPS.335.FTL Flight Duty Period (FDP)**

~~Flight time specification schemes for commercial operators shall specify the following FDP elements, where applicable to the type of operation:~~

~~(a) Maximum basic daily FDP;~~

~~(b) Reductions of the maximum basic daily FDP dependent on the number of sectors flown;~~

~~(c) Reductions of the maximum basic daily FDP when this maximum would start, end or encompass the Window of Circadian Low (WOCL);~~

~~(d) Conditions for extensions of the maximum basic daily FDP, taking into account:~~

~~(1) the number of sectors flown;~~

~~(2) FDPs within the WOCL;~~

~~(3) a maximum number of extensions for a consecutive number of days;~~

~~(4) increased pre and post flight minimum rest periods;~~

~~(5) periods off duty on ground during a single FDP;~~

~~(6) the minimum of in-flight break allocated to each crew member; and~~

~~(7) the augmentation of the basic flight crew~~

**Replace: Flight time specification schemes for commercial operators shall specify the following FDP elements, where applicable to the type**

of operation:

- (a) Maximum basic daily FDP of 13 hours;
- (b) Reductions of the maximum basic daily FDP dependent on the number of sectors flown (These 13 hours will be reduced by 30 minutes for each sector after the first.);
- (c) Reductions of the maximum basic daily FDP when this maximum would start, end or encompass the Window of Circadian Low (WOCL) with a maximum FDP of 10 hours for FDPs that encompass the WOCL;
- (d) Conditions for extensions of the maximum basic daily FDP, taking into account:
  - (1) the number of sectors flown;
  - (2) FDPs within the WOCL;
  - (3) a maximum number of extensions for a consecutive number of days;
  - (4) increased pre and post flight minimum rest periods;
  - (5) periods off duty on ground during a single FDP;
  - (6) the minimum of in-flight break allocated to each crew member
  - (7) the augmentation of the basic flight crew; and
  - (8) the augmentation of the basic cabin crew

**Reason:** The B R Art. 22 2. (a) states that I R shall include all substantive provisions of Subpart Q, taking into account latest scientific and technical evidence. The 13 hours maximum daily FDP must be considered a substantive provision and should therefore be reflected in the IR.

Taking into account latest scientific evidence, the MOEB US study recommends reducing the maximum basic FDP after the first sector and furthermore establishes the need for more scientific evaluation of any FDP that includes more than 4 sectors. Regarding FDP that include the WOCL, these should, according to the results of the MOEBUS study, never exceed 10 hours.

Regarding (6) the conditions for in-flight breaks should be established in CS, taking into account the recommendations of latest scientific evidence (MOEBUS study) and operational best practices.

#### **OR.OPS.350.FTL Standby duty**

- (a) Flight time specification schemes for commercial operators shall specify the following elements for standby duty, where applicable to the type of operation:
  - (1) A determination of the maximum length of any standby duty;
  - (2) The relationship between standby duty and any assigned flight duty resulting from the standby duty, taking into account facilities available for the crewmember to rest and other relevant factors;
  - (3) ~~A determination of the rest period following standby duty which does not lead to assignment on a flight duty;~~
  - (4) ~~How standby times are counted for the purposes of cumulative duty hours.~~
- (b) Where commercial operators assign crew members to standby duty, the following shall be considered, taking into account the type of operation:
  - (1) Standby duty shall be rostered and the affected crew members shall be notified in advance;
  - (2) The start and end time of the standby duty shall be defined and the affected crew members shall be notified in advance;
  - (3) Aerodrome/operating site standby duty shall start from the crew member reporting at the designated normal report point and shall end as notified.

**Request:** regarding (a)(1), CS, issued by EASA, should establish the

maximum length of any standby duty.

**Reason & JUSTIFICATION :** BR 216/2008, art. 22 2.(a): Latest scientific and technical evidence have to be taken into account; the results of the MOEBUS study have not been able to offer a conclusive result proposing a concrete maximum amount of hours, further medical studies should be commissioned. In the meantime CS should reflect national best practices: Example: The UK CAP 371 proposes a limit of 12 hours for all cases of standby (see 12.4 CAP 371, Section B, page 8).

**Request:** regarding (a)(2), 1.- CS, issued by EASA, should establish that airport standby cannot count as rest and should therefore be considered as FDP in its full extent.

2.- For standby other than airport standby, CS, issued by EASA should propose a formula to calculate the relationship between standby duty and the following FDP. This formula should be based on best national practices (i.e. UK CAP 371 12.4) and latest scientific and technical evidence; the answer to question 15 of the MOEBUS study requests more scientific evaluation of this problem, we therefore call upon EASA to commission further scientific evaluation of this item.

**Reason: 1.-** The MOEBUS study suggests in the answer to question 14: *... we know of no scientific evidence to suggest that airport standby should be considered as any less fatiguing than flight duty...*, leading to the conclusion that it should be considered as FDP.

**2.-** Existing national regulations, i.e. UK CAP 371, propose a formula to establish a relationship between standby duty and any assigned flight duty. These can be considered best practices and should therefore as stated in Art. 19 of the BR be reflected in CS. The answer to question 15 of the MOEBUS study suggests that sleep taken on standby is shorter and of poorer quality than normal sleep [Torsvall L & Åkerstedt T, 1988].

**Replace (a)(3):** The minimum rest period, as established in OR.OPS.355.FTL, following standby duty which does not lead to assignment on a flight duty;

**Reason:** BR 216/2008 art. 22, 2.(a) request IR based on substantive provisions of Subpart Q EU OPS; OPS 1.1110 1.1. establishes that *The minimum rest which must be provided before undertaking a flight duty period starting at home base shall be at least as long as the preceding duty period or 12 hours whichever is the greater; a crew member can be on standby duty, resting or on duty. Time spent on standby duty cannot be considered as rest, in order to meet this requirement, a minimum rest period has to be guaranteed after concluding a standby duty as scheduled and the following FDP.*

**Replace: (4)(1)** Standby times spent on airport standby are counted for the purposes of cumulative duty hours. (4)(2) How standby spent on standby other than airport standby times are counted for the purposes of cumulative duty hours.

**Reason:** BR 216/2008 art. 22, 2.(a) request IR based on substantive provisions of Subpart Q EU OPS; OPS 1.1125 establishes that *Airport standby will count in full for the purposes of cumulative duty hours.*

**Request regarding (4)(2):** The MOEBUS study suggests in the answer to question 16 that scientific studies on guidelines for the counting of time spent on standby (other than airport standby) would be difficult to undertake; BR 216/2008 art. 192. (a) mandates EASA to issue CS based on national best practices (i.e. UK CAP 371 22.3 Section B Page 14).

**Request regarding (b)(1) + (2): notified in advance, EASA should issue AMC on the meaning of "notified in advance".**

**Reason:** The term in advance in itself only means beforehand. This in itself does not provide legal certainty. The lack of definition of this item would certainly increase stress and fatigue levels in crew members.

### **OR.OPS.355.FTL Rest periods**

Flight time specification schemes for commercial operators shall specify the following rest elements, where applicable to the type of operation:

- (a) ~~Minimum rest periods in relation to the preceding duty period, which must be provided before undertaking a flight duty period starting either from home base or away from home base;~~
- (b) ~~Sleep opportunity before undertaking a flight duty period starting away from home base, depending on the preceding duty period;~~
- (c) Additional rest periods to compensate for the effects of time zone differences and extensions of the FDP;
- (d) ~~Weekly recurrent extended recovery rest periods to compensate for cumulative fatigue.~~

**Replace:** (a) (1) Minimum rest period at home base.

The minimum rest period provided before undertaking a flight duty period starting at home base is at least as long as the preceding duty period, or 12 hours, whichever is the greater.

(2) Minimum rest period away from home base.

The minimum rest period provided before undertaking a flight duty period starting away from home base is at least as long as the preceding duty period, or 10 hours, whichever is the greater.

**Reason:** Minimum rest and the definition of its duration have to be considered a substantive provision of Subpart Q EU OPS and have therefore to be included in the IR. (Art. 22 2.(a) BR 216/2008).

**Replace:** (b) The minimum rest period away from home base includes an 8 hour sleep opportunity taking account of travelling and other physiological needs, which has to be increased accordingly depending on the preceding duty period;

**Reason:** The definition of an 8 hour sleep opportunity seems a logical conclusion following the established 10 hours minimum rest and allowing for travel time to the place of rest, time to eat, bathe and other physiological needs. The US Federal Motor Carrier Safety Administration recommends a minimum of 8 hours of uninterrupted sleep per day for drivers.

**Request regarding (c):** Art. 19 2.(a) mandates EASA to develop CS

reflecting best practices and scientific and technical knowledge. When drafting these CS the Agency should at least take the following criteria into account:

**The definition of significant time-zone crossing: significant time-zone crossing is considered to cover more than two time zones within one FDP [Roach GD et al, 2002; Kantermann T et al, 2007].**

The minimum rest away from home base shall be increased to allow for additional resting time when the normal sleep time on the body clock does not overlap with the normal sleep time in the local environment at destination.

Additional rest on return to home base depending on the maximum time zone difference and preceding layover length, taking into account the recommendations made by MOEBUS in the answer to question 7 and national best practices. If time-zone crossing in one direction is followed by time-zone crossing in the opposite direction the additional rest at home base should be increased by an additional local night at home base.

**Replace: (d) A weekly recurrent extended recovery rest of at least 36 hours to compensate for cumulative fatigue, including two local nights, such that there are never more than 168 hours between the end of one recurrent extended recovery rest period and the start of the next.**

**Reason: BR 216/2008 Art. 22, 2. (a): The weekly extended recovery rest is to be considered a substantive provision of Subpart Q EU OPS and has therefore to be included in IR, taking into account the latest scientific and technical evidence;**

#### **CS FTL.1.135 Maximum daily Flight Duty Period (FDP)**

(a) Maximum daily FDP without the use of extensions.

The maximum basic daily FDP shall be 13 hours which shall be reduced by 30 minutes for each sector from the third sector onwards and be further reduced (up to a maximum of two hours) when the WOCL is encroached in accordance with the limits specified in the table below:

**Comment: The provisions on maximum daily FDP should be reflected in IR.**

**Reason: Maximum daily FDP is to be considered a substantive provision of Subpart Q EU OPS (BR 216/2008 Art 22, 2. (a)).**

~~(b) Maximum daily FDP with the use of extensions.~~

~~The maximum daily FDP can be extended by up to one hour and this extension is limited to a maximum of 5 sectors. The extension is further reduced to a maximum of four sectors when the WOCL is encroached and to a maximum of two sectors when FDP encroaches the WOCL by more than two hours with the limits specified in table below:~~

~~...~~

~~The maximum number of times that extensions can be used is two in any seven consecutive days. Where an FDP is planned to use an extension, the minimum pre-flight and post-flight rest periods are increased by two hours, or post-flight rest only is increased by four hours. Where the extensions are used for consecutive FDPs the pre and post rest between the two operations run consecutively.~~

**Comment: Delete point (b)**

**Reason:** The proposed IR should take into account the latest scientific and technical evidence into account (BR 216/2008 Art. 22, 2. (a)); the MOEBUS study, in its answers to questions 2 and 3 quotes numerous scientific studies to substantiate their recommendation to remove the provision for extensions to maximum daily FDP unless flight and cabin crew are augmented and in-flight breaks and the corresponding adequate rest facilities on board are defined in CS (see answers to questions 12 and 13 MOEBUS study).

(c) FDP with different reporting time for flight crew and cabin crew  
~~In cases where cabin crew require more time than the flight crew for their pre-flight briefing for the same flight or series of flights, the FDP of the cabin crew may be extended by the difference in reporting time between the cabin crew and the flight crew, as long as the difference does not exceed 60 minutes.~~

**Replace:** In the cases, defined in the applicable flight time specification scheme and appropriate for the type of operation, where cabin crew require more time than the flight crew for their pre-flight briefing for the same flight or series of flights, the FDP of the cabin crew may be extended by the difference in reporting time between the cabin crew and the flight crew, as long as the difference does not exceed 30 minutes and the reporting time for flight crew and cabin crew fall in the same circadian time category.

**Reason:** In order to take into account the latest scientific and technical evidence (see answer to question 5 of the MOEBUS study) operators should develop more efficient briefing techniques; when approving a flight time specification scheme proposing different reporting times for flight and cabin crew the Agency should pay special attention to the fact that this extension of the maximum FDP can only be used where strictly safety related duties make this necessary.

#### **CS FTL.1.140 Flight times and duty periods**

~~(a) The total duty periods to which a crew member is assigned shall not exceed:~~  
~~(1) 60 duty hours in any seven consecutive days;~~  
~~(2) 190 duty hours in any 28 consecutive days.~~

**Replace:** (a) The total duty periods to which a crew member is assigned shall not exceed:  
 (1) 60 duty hours in any seven consecutive days;  
 (2) 180 duty hours in any 28 consecutive days.  
 (3) 100 duty hours in any 14 consecutive days.

**Reason:** See reason for proposed change to OR.OPS.040.FTL. An additional limit of 100 duty hours in any 14 consecutive days should be introduced in the CS guarantee that duty is spread out as evenly as possible. (See answer to question 1 MOEBUS study).

(b) The total flight time of the flights on which an individual crew member is assigned as an operating crew member shall not exceed:  
 (1) 100 flight hours in any 28 consecutive days;  
 (2) 900 flight hours in any 12 consecutive calendar months.

**Comment:** The limits reflected in (b) should be reflected in IR; they are

**to be considered substantive provisions of Subpart Q E U OPS and BR 216/2008 Art. 22, 2. (a) and should therefore be included in IR.**

(c) The total duty periods and total flight times referred to in (a) and (b) above should be spread as evenly as practicable throughout their respective periods.

**Replace:** "possible"

**Reason:** The word practicable leads to the conclusion that this only should be done where no additional cost is generated. The present OPS is intended to avoid cumulative fatigue and increase flight safety. Operators should be encouraged to do everything possible within their operational limits to comply with this.

### **CS FTL.1.155 Minimum Rest Period**

(a) Minimum rest period at home base.

The minimum rest period provided before undertaking a flight duty period starting at home base is at least as long as the preceding duty period, or 12 hours, whichever is the greater.

(b) Minimum rest period away from home base.

The minimum rest period provided before undertaking a flight duty period starting away from home base is at least as long as the preceding duty period, or 10 hours, whichever is the greater. The minimum rest period away from home base includes an 8 hour sleep opportunity taking account of travelling and other physiological needs

(c) Recurrent extended recovery rest periods

The minimum recurrent extended recovery rest period to compensate for cumulative fatigue is a 36hour period including two local nights, such that there are never more than 168 hours between the end of one recurrent extended recovery rest period and the start of the next.

**Comment:** The provisions of this CS should be included in IR as they are substantive provisions of Subpart Q EU OPS (BR 216/2008 Art. 22, 2. (a)).

### **CS FTL.1.160 Un foreseen circumstances in actual flight operations – discretion by the pilot in command**

(a) The conditions for the modification of the limits on flight duty, duty and rest periods by the pilot in command in the case of unforeseen circumstances in actual flight operations, and after the reporting time, should comply with the following:

(1) The maximum basic daily FDP which results after applying CS FTL.1.135 (b) and (c) may not be increased by more than two hours unless the flight crew has been augmented, in which case the maximum flight duty period may be increased by not more than 3 hours;

~~(2) The maximum basic daily FDP which results after applying CS FTL.1.135 (b), (c) and (d) may not be increased by more than one hour unless the flight crew has been augmented, in which case the maximum flight duty period may be increased by not more than 2 hours;~~

(3) If on the final sector within a FDP unforeseen circumstances occur after take off that will result in the permitted increase being exceeded, the flight may continue to the planned destination or alternate;

(4) In the event of such circumstances, the rest period following the FDP may be reduced but never below the minimum rest period defined in CS FTL.1.155

(b).

~~(b) The pilot in command should consult all crew members before deciding these modifications.~~

**Replace with: "flight and cabin"**

**Reason: When developing CS the Agency should reflect scientific and technical knowledge, The MOE BUS study in the answer to question 5 quotes numerous recent scientific studies showing that cabin crew are more likely to be affected by hypoxia and other fatigue increasing factors than flight crew, therefore an order to guarantee a satisfactory level of alertness in the cabin crew towards the end of the FDP the use of the provisions in CS FTL.1.160 should be limited to flights with augmented flight and cabin crew. From the viewpoint of general health, physiological needs, and required levels of alertness, the same requirements for flight and cabin crew should be applied.**

**Delete: (2)**

**Reason: CS FTL.1.135 (d) does not exist therefore there is no difference between (1) and (2).**

**Replace: (b) The pilot in command should consult all crew members before deciding these modifications. At least the minimum number of cabin crew defined in OR.OPS.105.CC and OR.OPS.205.CC should have declared in the consultation to feel sufficiently free of fatigue to continue their duty beyond the established maximum FDP defined in OR.OPS.335.FTL Flight Duty Period (FDP) and CS FTL.1.135 Maximum daily Flight Duty Period (FDP).**

**Reason: The ER laid down in 7.f. of Annex IV to BR 216/2008 establishes a personal responsibility to all crew members: 7.f. "No crew member must allow their task achievement/decision making to deteriorate to the extent that flight safety is endangered because of the effects of fatigue, taking into account, *inter alia*, fatigue accumulation, sleep deprivation, number of sectors flown, night duties or time zone changes. Rest periods must provide sufficient time to enable crew members to overcome the effects of the previous duties and to be well rested by the start of the following flight duty period."**

#### **AMC OR.OPS.015.FTL(I) Operator responsibilities**

The operator should take action to change a schedule or crewing arrangements where the actual operation exceeds the maximum flight duty period, during a scheduled seasonal period, by more than:

**Replace: arrangements, the latest**

**Reason: The AMC as proposed initially by the Agency is less restrictive than the corresponding OPS in Subpart Q EU OPS; its intention should be to correct schedule or crewing arrangements as soon as the operator realizes that a certain flight operation exceeds the maximum flight duty period in a significant number (33%) of scheduled flights and not after completing an entire season.**

#### **AMC OR.OPS.330.FTL(c) Flight time specification schemes for commercial operators**

(b) The details regarding consultation with the affected groups should describe the consultation with scheduling managers, ~~crew member representatives~~, etc., as applicable.

**Replace: "crew member representatives and how these are elected"**

**Reason: It is of paramount importance when evaluating the results of consultation to include how the crew member representatives have been elected. Many airlines do not have elected, organized crew member representatives and the value of a consultation to crew member representatives chosen by the management is questionable if not worthless.**

**AMC OR.OPS.040.FTL Flight times and duty periods**

(a) The total duty periods and total flight times referred to in OR.OPS.040.FTL (a) and (b) should be spread as evenly as practicable throughout their respective periods.

(b) In addition to the time periods specified in OR.OPS.040.FTL, operators may include additional limitations, such as duty hours in any 14 consecutive days, if considered useful for fatigue mitigation.

**Replace: (a) possible**

**Reason: The word practicable leads to the conclusion that this only should be done where no additional cost is generated. The present OPS is intended to avoid cumulative fatigue and increase flight safety. Operators should be encouraged to do everything possible within their operational limits to comply with this.**

**Comment: (b) This provision should be in IR or at least in CS.**

**Reason: The Agency should reflect scientific and technical knowledge in CS (BR 216/2008 Art. 19, 2.); without the additional limitation three consecutive 60 hour weeks would be allowed entering in contradiction with the requirement to spread out duty hours.**

comment by: ECA - European Cockpit Association

Comment on OR.OPS.010.FTL: add new definition:

**Acclimatised: A crew member will be or become acclimatised after having spent 3 consecutive local nights on the ground within a time zone which is 2 hours wide, and was able to take uninterrupted night sleep. The crew member will remain acclimatised thereafter until a duty period finishes at a place where local time differs by more than 2 hours from that at the point of departure and to which the crew member was acclimatised to; now the crew member became non-acclimatised.**

Justification:

Strong recommendation from the medical review (Moebus Aviation):

Define acclimatization and develop appropriate rules to address the effect of de-synchronization.

comment 1066 comment by: ECA - European Cockpit Association

Comment on OR.OPS.010.FT: Add definition for crew rest facility as follows :

Crew rest definitions:

(1) Bunk facility: It should be completely separated (curtain not accepted) from cockpit and passenger compartment and should be adequately insulated and situated to minimize random and aircraft noise and light (maximum noise level has to be defined in accordance with acceptable requirement for sleeping). It should contain one or two horizontal sleeping surfaces of adequate size (that should be defined as well, and mattress equipped). It also has a comfortable seat, climate and humidity control (with minimum performance specifications). Accessories such as ears caps, eyes masks, blankets and pillows should be provided.

(2) Seat facility: It should be separated from cockpit and passenger by the mean of curtains or partitions and equiped with adjustable headrest, armrest and footrest. Its back should incline by at least 60° from horizontal and the seat's wide shouldn't be less than 60 cm between armrest. Accessories such as ears caps, eyes masks, blankets and pillows should be provided to minimize light or noise effects.

Justification:

Many companies, mainly charters, operate long haul flights with aircraft which are not crew rests equipped.

In such companies, business classes don't exist or if they do, are underrated (in term of comfort) compared with main operators.

In addition, augmented crew regulation in term of FDP extension due to in-flight rest is diverted from its purpose by operators using it on round trip medium range sectors, with aircraft which are not crew rests equipped.

In order to avoid those diversions and to enable crew members to effectively rest during flight, it seems important to precisely define what equipment can reasonably be considered as crew rests.

The final target should be to avoid in the future, that any constructor could sell long haul aircraft with no acceptable crew rests.

See also Moebus study.

comment 1067 comment by: ECA - European Cockpit Association

Comment on OR.OPS.010.FT: add the following definition:

**In-flight break** is a period free of all duties, included in a flight, which counts as flight duty.

Justification:

"in-flight break" constitutes an expression on its own and shall be clearly separated from "break" or "rest"

comment 1068 comment by: ECA - European Cockpit Association

Comment on OR.OPS.010.FTL: add new definition:

**Break** means a period free of all duties, not included in a flight, which counts as duty, being less than a rest period.

Justification:  
Definition to be added. Used for split duty if it is still allowed.

comment 1069 comment by: ECA - European Cockpit Association

Comment on OR.OPS.010.FTL (c):

(c) 'Duty' means any task that a crew member is required by the operator to perform, including, for example, flight duty, administrative work, training, positioning, **airport standby and other forms of and** ~~standby in an a limited way but always when it is likely to induce fatigue;~~

Justification:

Strong support for the clarification using examples. Even if rather obvious, these points have lead to discussions under Subpart Q. All airport standbys shall count as duty; other forms of standby shall count as duty in a limited way. See also OR.OPS.050.FTL for further information.

Moreover, "when it is likely to induce fatigue" should be deleted. Standby IS duty !

comment 1070 comment by: ECA - European Cockpit Association

Comment on OR.OPS.010.FTL (b)(4): rewording required:

"at rest" for a balloon is not precise enough. It may be interpreted as requiring the balloon to be deflated.

comment 1071 comment by: ECA - European Cockpit Association

Comment on OR.OPS.010.FTL (d):

The change from EU OPS on the wording, from "*commence a duty*" to "*report for commencing a duty*" has been noted, but it is accepted.

comment 1072 comment by: ECA - European Cockpit Association

Comment on OR.OPS.010.FTL(f): change text as follows:

Flight duty period means a period which commences when a crew member is required to report for duty that includes a flight or a series of flights and which finishes when ~~the aeroplane finally comes to rest and the engines are shut down at the end of the last flight on which he/she is a flight crew member and when all safety related duties are terminated. all safety related duties are terminated after the aeroplane finally comes to rest and the engines are shut down at the end of the last flight on which he/she is a flight crew member.~~

Justification:

OPS 1.085 (f) defines that a flight lasts until the commander has left the aircraft.

In contrast, OR.OPS.010.FTL (f) does not properly address safety related duties associated to the flight and relevant to the safety of the passengers, its cargo or the aircraft under the fatigue aspect. These duties shall be considered flight duty for all flights of a flight duty period except for the last one.

The definition of a Flight Duty Periods in this scheme must consider that not only the safety related duties of the initial flights are counted as flight duty but also the safety related duties required at the end of the last flight. These duties must be completed without crew members being unacceptably fatigued which otherwise would challenge the safety of their passengers, cargo or aeroplane. Dependant on the operation, the flight duty period may not automatically terminate when the aeroplane comes to rest and the engines are shut down. In cases where the crew's responsibility for the safety of the passengers, the cargo or the aeroplane continues beyond on blocks, the FDP must continue until this responsibility ends.

The text does not state an end of the FDP for sailplanes and balloons as mentioned in definition of "*Flight time (b)*".

comment

comment by: ECA - European Cockpit Association

Comment on OR.OPS.010.FTL(i):

(i) **Local night** means a period of **eight to n** hours falling between 22:00 hours and 10:00 hours local time;

Justification:

The present wording using "... a period of 8 hours falling between 22:00 and 10:00" derives from a required 8 hour sleep period. Due to the time required for physical need as well as for transferring from/to the place of duty to the present definition does not sufficiently protect the sleep during the WOCL. Consequently the medical evaluation recommends a period of 10 hours falling between 22:00 and 10:00 LT. (See also Moebus study)

comment

1074

comment by: ECA - European Cockpit Association

Comment on OR.OPS.010.FT (I):

**Positioning** means the transferring of a non-operating crew member from place to place, at the behest of the operator, excluding the time from home to a designated reporting place **at the home base** and vice versa, or time for local transfer from a place of rest to the commencement of duty and vice versa; **should a single transfer exceed 30 minutes the excess must be counted as positioning.**

Justification:

"Designated reporting place" shall be supplemented by "home base". Otherwise the "designated reporting place" could be altered as needed which would transfer factual positioning from duty to rest.

To prevent infinite local transfer especially prior to a FDP, a limitation must be included:

"Local transfer exceeding one hour shall count as positioning".

comment

1076

comment by: ECA - European Cockpit Association

Comment on OR.OPS.010.FTL(o): change as follows:

**Window of Circadian Low (WOCL)** means the period between 02:00 hours and 05:59 hours. Within a band of ~~three-five~~ time zones with the home base time zone in the middle the WOCL refers to home base time. ~~Beyond these three time zones the WOCL refers to home base time for the first 48 hours after departure from home base time zone and to local time thereafter. For the first 48 hours after reporting for a duty period which terminates outside the band as described above the WOCL refers to home base time and to local time thereafter.~~

Justification:

The present definition is rather ambiguous and requires further interpretation. The reference to home base is misleading. Reference should be made to the last time zone where the crew member has spent 48 hours or more. Initially, the text should be adjusted to meet the following guide line:

The "band of three time zones" shall be understood as a string band with a length of up to two hours attached to the home base local time on one end and the destination local time on the other. Thus flights from a place with a time difference of up to two hours east of the home base local time to a place with a time difference of up to two hours west of the home base local time or vv. could be operated with reference to home base time, provided that the crew member has not taken a rest period outside this band since leaving home base:

Whenever a crew member, who stayed within the band as described above, ends a duty at a place with a difference in local time of more than 2 hours to the start of this duty, i.e. when a crew member becomes (... and also when already non- acclimatized):

- (1) The following rest periods shall not be less than 14 hours until the crew member becomes acclimatized again.
- (2) Upon return to home base at least a single day free of duty shall be given.

The Scientific and Medical Evaluation of Flight Time Limitations explicitly demands provisions to resynchronize crews which were exposed to time zone transitions (see page 37 of the report).

comment

comment by: Sven Freisenich

## Definitions (c) Duty

Wording is too imprecise. Not all standby is duty or induces fatigue. How is fatigue due to standby to be determined? Same applies to rest, where the operator also cannot assess fatigue. Perhaps EASA means "Standby duty" (OR.OPS.050.FTL), which is included in "duty" anyhow. Therefore "...and standby when is likely to induce fatigue." shall be deleted.

## Definitions (n) Standby

Therefore, add new definition clearly specifying "Standby duty" means "Aerodrome/operating site standby" as used in OR.OPS.050.FTL and OR.OPS.350.FTL, e.g. "standby duty" is the only standby that is likely to induce fatigue.

## Definition (e) Flight crew member and (k) Operating crew member

Definitions are confusing. What is the difference between "assigned to duty" and "carries out their duty". EASA shall clarify why they need both definitions.

## Definition (j) a single day free of duty

Delete this definition, as this is only used under OR.OPS.010 Definitions, and nowhere else in this NPA.

Motivation: This is not a safety issue, but a social issue and does not belong in these requirements. Days off are already covered by the European Working Time Directive.

## Definition (l) positioning

Editorial: "means the transferring of a non-operating crew member from place to place, at the behest of the operator, excluding the time from home to a designated reporting place and vice versa, or **excluding** time for local transfer from a place of rest to the commencement of duty and vice versa;"

## Definition (o) Window of Circadian Low

-Although definition is the same as in EU-OPS it is still unclear and leaves room for different interpretations.

-Change "band of three time zones" into "three hours time difference".

-EASA shall better define "departure from home base time zone": does it mean when the time zone is left or does it mean when previous FDP at home base started ?

-A crew member can be en-route for 10 days from eg. AMS tot DXB to BKK to HKG to SYD to BKK to DXB. Then on departing from DXB to AMS he would have to use "home base time" after having been used to far greater time differences for the last 10 days. In fact using AMS time would enhance the negative effect of time zone crossings. The same problem appears when home base is AMS and crew member operates for 10 days in Africa. He would have to use AMS time while he is acclimatised to Africa time.

**Proposed definition:**

WOCL means the period between 02:00 hours and 05:59 hours. WOCL refers to home base time.

Beyond three **hours** time difference **AND** beyond 48 hours after departure from home base time, WOCL refers to local time.

comment 1281

comment by: Dassault Aviation

Technical comment:

Page 25 OR.OPS.010.FTL Definitions: First comment is on definition of "Flight Duty Period (FDP)": bearing in mind the fatigue issue, a simulator session

should be considered as integral part of FDP. Indeed, there is nothing uncommon to see a flight crew member jumping from the simulator to the aircraft or vice versa. Rostering a four hours simulator session and an onward ten hours flight duty is definitely not a safe practice. In fact, the pilot should be tired at take off time and psychologically not fit to operate a normal flight (he is still in the simulator session, dealing with emergency procedures). Second comment is on definition of "Standby": Airport and home standby (also called reserve) should be differentiated since the fatigue generated by an airport standby is noticeably greater than the one generated by a home standby.

comment

comment by: UK CAA

**Page No:** 25**Paragraph No:** OR.OPS.010.FTL

**Comment:** OR.OPS.010.FTL breaks down the word "crew member" into "flight crew", "cabin crew" and "technical crew" members. A definition for "flight crew" is given at (e) but no definitions are given for other crew members.

**Justification:** Include for completeness

**Proposed Text (if applicable):**

"Cabin crew member" means those members of the crew carried for the purpose of performing duties in relation to the safety of passengers and who shall not act as a member of the flight crew or technical crew.

"Technical crew member" means those members of the crew carried for the purpose of duties other than cabin or flight crew who are needed to operate specified equipment or to carry out specified tasks and who shall not act as a member of the flight crew or cabin crew.

comment

1291

comment by: UK CAA

**Page No:** 24

**Paragraph No:**  
OR.OPS.010.FTL(b)(2)

**Comment:**

The definition of 'Flight' would impact current practice so that, where it has been previously accepted that helicopters may ground taxi for the purpose of positioning to embark passengers *without* being considered in flight, the new definition would require accounting for ground taxi time as flight. Offshore operators, in particular, could lose up to 20 minutes of available total flight time per flight.

**Justification:**

The new definition of 'flight' would unreasonably impact on current practice by requiring ground taxiing to be accounted for as flight.

**Proposed Text (if applicable):**

For helicopters, the total time from the moment, after the embarkation of its crew for the purpose of taking off, when it first moves under its own power until the moment when it next comes to rest after landing;

**Page No:** 24**Paragraph No:**  
OR.OPS.010.FTL (c)**Comment:**

The definition of "duty" in this subparagraph (although virtually identical to that in Amendment 33 to ICAO Annex 6 Part 1) could be simplified and made more explicit. It is thought that all tasks within a duty have the potential to induce fatigue so the sub-clause "likely to induce fatigue" is considered to be irrelevant. It is further suggested that the definition should be amended to remove the possibility of an argument being put forward at some later stage that a particular task did not count for duty purposes, as it was not a fatigue inducing task or duty.

**Justification:**

Additional clarification / simplification.

**Proposed Text (if applicable):**

"Duty" means any period during which a crew member is required by the operator to perform any task associated with the business of the operator.

comment by: UK CAA

**Page No:** 25**Paragraph No:** OR.OPS.010.FTL (o)**Comment:**

The time period given for the "Window of Circadian Low" (WOCL), is related to the local time of the zone to which the individual is (or has become) acclimatised. Whilst the current definition does eventually explain this, it is suggested that the definition could be made more clear. The suggested text tries to provide this extra clarity.

**Justification:**

Extra clarity.

**Proposed Text (if applicable):**

~~The Window of Circadian Low (WOCL) is the period between 0200 and 0559 hours. Within a band of three time zones the WOCL refers to home base time. Beyond these three time zones the WOCL refers to home base time for the first 48 hours after departure from home base time zone, and to local time thereafter.~~

*"Window of Circadian Low (WOCL)" means the period between 0200 hours and 0559 hours local time of the zone to which the individual is (or has become) acclimatised. Provided an individual remains within a band of 3 time zones (i.e. a total of 2 hours time difference) the WOCL refers to local "home base" time. Beyond these 3 time zones the WOCL refers to home base time for the first 48 hours after departure from home base time zone and to local time thereafter.*

comment by: M Wilson-NetJets

**Original text:**

(o) 'Window of Circadian Low (WOCL)' means the period between 02:00 hours and 05:59 hours. Within a band of three time zones the WOCL refers to home base time. Beyond these three time zones the WOCL refers to home base time for the first 48 hours after departure from home base time zone and to local time thereafter.

**Suggested new text:**

(o) 'Window of Circadian Low (WOCL)' means the period between 02:00 hours and 05:59 hours.

**Comment/suggestion:**

OR.OPS.010.FTL is the definitions paragraph of the IR. The research on acclimatization of aircrew is scientifically still immature and mainly focused on scheduled operations. The inclusion of a form of acclimatization in the definition paragraph of an IR does not allow unscheduled/on-demand operators to improve safety in the future when more research and experience has been accumulated for non-scheduled acclimatization of aircrew. Therefore it is suggested to remove the acclimatization part of the WOCL definition and publish it in the CS or AMC part of the legislation.

comment

comment by: M Wilson-NetJets

**Original text:**

(g) 'Home base' means the location nominated by the operator to the crew member from where the crew member normally starts and ends a duty period or a series of duty periods;

**Suggested new text:**

No suggested text

**Comment/suggestion:**

Home base is centralized operator concept and to allow other types of operations (mainly decentralized) to be able to devise the most flexible, safe and economically advantageous FTL scheme the definition should not be defined in an IR but in the CS/AMC part of the regulation.

comment by: British Airways

Augmented Flight Crew – defined but not used for any purpose within the NPA apart from FRMS references. How do we include augmentation as part of the extension of Flying Duty Periods?

Duty – we propose an alternative definition – *'Any continuous period during which a crew member is required to carry out any task associated with the business of an aircraft operator.'*

Positioning – Include the word 'excluding' in text to read: 'Positioning' means

the transferring of a non-operating crew member from place to place, at the behest of the operator, excluding the time from home to a designated reporting place and vice versa, or **excluding** time for local transfer from a place of rest to the commencement of duty and vice versa

Standby Duty – we propose an alternative definition - *'A period during which an operator places restraints on a crew member who would otherwise be off duty. However, it shall not include any time during which an operator requires a crew member to be contactable for the purpose of giving notification of a duty which is due to start 10 or more hours ahead.'*

Split Duty – there currently isn't any definition of what constitutes a 'Split Duty'. The following definition needs to be added.

*'A single flying duty period containing opportunity for rest on the ground of less than a minimum rest period, the portion preceding the rest being an operating or positioning sector, or a simulator duty which counts as a sector for this purpose.'*

WOCL (window of circadian low) – The proposed definition refers to 'a band of three time zones', however not all time zones are an hour wide (e.g. India). Should this definition refer to within three **hours** of home base time not three time zones.

comment 1847

comment by: *fédération des transports CGT, membre de ETF*

CGT member of ETF propose:

(a) **Insert:** 'Augmented cabin crew' means a cabin crew complement which comprises more than the minimum number required to operate the aircraft and within which each fully qualified cabin crew member can leave their assigned post and be replaced by another appropriately qualified cabin crew member for the purpose of in-flight break;

Reason: When operating flights with in-flight break the minimum cabin crew should be on duty in order to attend in-flight emergencies appropriately.

(c) 'Duty' means any task that a crew member is required by the operator to perform, including, for example, flight duty, administrative work, training, positioning, ~~and standby when it is likely to induce fatigue;~~

**Replace:** airport standby and all other forms of standby

Reason: The MOEBUS study in its answer to question 15 establishes that sleep taken on standby is shorter and of poorer quality and therefore induces fatigue. Moreover, BR 216/2008 establishes in Art. 22 2.(a) that Initially, the implementing rules shall include all substantive provisions of Subpart Q of Annex III to Regulation (EEC) No 3922/91. In order to meet this essential requirement provisions of Subpart Q OPS 1.1125 should be taken into account. The mentioned OPS read:

1.2. Airport standby will count in full for the purposes of cumulative duty hours.

1.3. Where airport standby is immediately followed by a flight duty, the relationship between such airport standby and the assigned flight duty shall be defined by the Authority. In such a case, airport standby shall be added to the duty period referred to in OPS 1.1110 under points 1.1 and 1.2 for the purposes of calculating minimum rest.

1.4. Where the airport standby does not lead to assignment on a flight duty, it shall be followed at least by a rest period as regulated by the Authority.

Leading to the conclusion that airport standby needs be followed by minimum rest because it generates fatigue.

Request: CS, AMC or GM is needed to define to what extent standby other than airport standby generates fatigue. The MOEBUS study in its answer to question 15 reports that sleep taken is shorter and of poorer quality. They propose a sliding scale and call for further scientific research. This is in line with the requirements of Art 19, 2. of Regulation 216/2008.

(f) 'Flight Duty Period (FDP)' means a period which commences when a crew member is required to report for duty that includes a flight or a series of flights and which finishes ~~when the aircraft finally comes to rest and the engines are shut down or the rotor blades are stopped, at the end of the last flight on which they are a crew member;~~

**Replace:** When all passengers have disembarked on commercial operations and crew duties and checks have been completed as required by the authorities and operators;

Reason: Even after the engines have been shut down, i.e. during disembarkation, it could become necessary to initiate an evacuation. FDP and its limitations are designed to make sure that crew members are alert to do so. All safety related tasks should be carried out during the FDP.

(i) 'Local night' means a period of ~~eight hours falling between 22:00 hours and 08:00 hours~~ local time;

**Replace:** ten hours falling between 22:00 hours and **10:00**

Reason: The term 'local night' is used in the IR to establish a weekly rest period which is clearly intended to mitigate the effect of cumulative fatigue. The MOEBUS study indicates in the answer to question 10 that there is scientific evidence that shows that the effectiveness of the second night sleep (see OR.OPS.355.FTL (d) and CS FTL.1.155 (c)) is limited if the second night is followed by a duty period starting as early as 06:00.

(l) 'Positioning' means the transferring of a non-operating crew member from place to place, at the behest of the operator, excluding the time from home to a ~~designated reporting place~~ and vice versa, or time for local transfer from a place of rest to the commencement of duty and vice versa;

**Replace:** their designated home base as defined in (g) OR.OPS.010.FTL

Reason: The home base is the designated reporting place after resting at home.

comment by: BALPA

Section (a) - Augmented flight crew

Please advise where we can find a definition of an "inflight break."

The NPA does not mention the process for which "Augmented flight crew" are used (extension of a FDP) and also makes no provision for the balance of rest between crewmembers.

Section (b) - Flight time

The NPA states that the aircraft has only to move from its parking position for the purpose of taking off. Please clarify the situation if a crew return to stand after pushback but before getting airborne. Will this count as Flight time? Our suggestion would be to incorporate the words "after landing" to avoid confusion. Section (b2) makes the definition clear.

The Maximum daily Flight Duty Period tables found in CS.FTL.1.135 still refer to *sectors* rather than Flight time. There is no definition of Sector within OR.OPS.010.FTL - please clarify.

Section (c) - Duty

We don't agree with "...and standby when it is likely to induce fatigue" being an example. We believe that duty is duty and should be counted as such.

Section (g) - Home base

Please clarify the word "normally". How would this section view a crewmember having one "home base" that included multiple departure points (LGW and LHR or MXP, LIN and BGN)? It is essential that an individual only has one reporting point to avoid excessive travelling time, that will cause fatigue. See also response to AMC.OR.OPS.FTL (b) NOMINATION OF A HOME BASE.

Section (i) - Local night

This section needs to take into account the recommendations from the Moebius report - "2200 to 1000".

Section (j) - A single day free of duty

The NPA has no definition of a "single day". What definition would you use for consecutive periods free of duty i.e. 2 days free of duty? If the definition was changed to Day off this could include one "Local Day" and two "Local nights" which have already been defined?

Section (k) - Operating crew member

For the avoidance of doubt, we believe including "or during any part of the flight" should be included at the end of the sentence.

Section (l) - Positioning

The time spent positioning should be counted as duty. There is no mention of this in this section. However, this is covered in OR.OPS.045. Please confirm that any time spend Positioning is counted as duty.

"..designated reporting place.." needs to be replaced by "Homebase".

**General comments**

Further to our comments in CS.FTL.1.135, a definition of "non-acclimatised" is required.

(a)

Insert: 'Augmented cabin crew' means a cabin crew which comprises more than the minimum number required to operate the aircraft and within which each cabin crew member can leave their assigned post and be replaced by another appropriately qualified cabin crew member for the purpose of in-flight break;

Reason: When operating flights with in-flight break the minimum cabin crew should be on duty in order to attend in-flight emergencies appropriately.

(c) 'Duty' means any task that a crew member is required by the operator to perform, including, for example, flight duty, administrative work, training, positioning, ~~and standby when it is likely to induce fatigue;~~

Replace: airport standby and standby other than airport standby

Reason: BR 216/2008 establishes in Art. 22 2.(a) that Initially, the implementing rules shall include all substantive provisions of Subpart Q of Annex III to Regulation (EEC) No 3922/91. In order to meet this essential requirement provisions of Subpart Q *OPS 1.1125* should be taken into account. The mentioned OPS reads:

1.2. Airport standby will count in full for the purposes of cumulative duty hours.

1.3. Where airport standby is immediately followed by a flight duty, the relationship between such airport standby and the assigned flight duty shall be

defined by the Authority. In such a case, airport standby shall be added to the duty period referred to in OPS 1.1110 under points 1.1 and 1.2 for the purposes of calculating minimum rest.

1.4. Where the airport standby does not lead to assignment on a flight duty, it shall be followed at least by a rest period as regulated by the Authority.

Leading to the conclusion that airport standby needs be followed by minimum rest because it generates fatigue.

Request: AMC or GM is needed to define whether standby other than airport standby generates fatigue or not. Further scientific is needed. The MOEBUS study could not establish criteria to what extent standby has to taken into account when counting cumulative duty hours. This is needed in order to meet the ER that establishes that the latest scientific and technical evidence shall be taken into account when proposing new FTL IR.

(f) 'Flight Duty Period (FDP)' means a period which commences when a crew member is required to report for duty that includes a flight or a series of flights and which finishes when the aircraft finally comes to rest and the engines are shut down or the rotor blades are stopped, at the end of the last flight on which they are a crew member;

Replace: a certain amount of time after the aircraft finally comes to rest and the engines are shut down or the rotor blades are stopped allowing for safety and security related tasks to be completed, at the end of the last flight on which they are a crew member;

Reason: Even after the engines have been shut down, i.e. during disembarkation, it could become necessary to initiate an evacuation. FDP and it's limitations are designed to make sure that crew members are alert to do so. All safety related tasks should be carried out during the FDP.

(i) 'Local night' means a period of ~~eight hours falling between 22:00 hours and 08:00 hours~~ local time;

Replace: **ten** hours falling between 22:00 hours and **10:00**

Reason: The term 'local night' is used in the IR to establish a weekly rest period which is clearly intended to mitigate the effect of cumulative fatigue. The MOEBUS study indicates in the answer to question 10 that there is scientific evidence that shows that the effectiveness of the second night sleep (see OR.OPS.355.FTL (d) and CS FTL.1.155 (c)) is limited if the second night is followed by a duty period starting as early as 06:00.

(l) 'Positioning' means the transferring of a non-operating crew member from place to place, at the behest of the operator, excluding the time from home to a designated reporting place and vice versa, or time for local transfer from a place of rest to the commencement of duty and vice versa;

Replace: time, *limited to one hour* for local transfer from a place of rest to the commencement of duty and vice versa

Reason: The place of rest away from home base is chosen by the operator, if for any reason the operator chooses a place further away than a one hour transfer from the reporting point, the transfer time should be counted as FDP as it generates fatigue.

comment by: UCC SLO

(a)

Insert: 'Augmented cabin crew' means a cabin crew which comprises more than the minimum number required to operate the aircraft and within which each cabin crew member can leave their assigned post and be replaced by another appropriately qualified cabin crew member for the purpose of in-flight break;

Reason: When operating flights with in-flight break the minimum cabin crew should be on duty in order to attend in-flight emergencies appropriately.

(c) 'Duty' means any task that a crew member is required by the operator to perform, including, for example, flight duty, administrative work, training, positioning, ~~and standby when it is likely to induce fatigue;~~

Replace: airport standby and standby other than airport standby

Reason: BR 216/2008 establishes in Art. 22 2.(a) that Initially, the implementing rules shall include all substantive provisions of Subpart Q of Annex III to Regulation (EEC) No 3922/91. In order to meet this essential requirement provisions of Subpart Q OPS 1.1125 should be taken into account. The mentioned OPS reads:

1.2. Airport standby will count in full for the purposes of cumulative duty hours.

1.3. Where airport standby is immediately followed by a flight duty, the relationship between such airport standby and the assigned flight duty shall be defined by the Authority. In such a case, airport standby shall be added to the duty period referred to in OPS 1.1110 under points 1.1 and 1.2 for the purposes of calculating minimum rest.

1.4. Where the airport standby does not lead to assignment on a flight duty, it shall be followed at least by a rest period as regulated by the Authority.

Leading to the conclusion that airport standby needs be followed by minimum rest because it generates fatigue.

Request: AMC or GM is needed to define whether standby other than airport standby generates fatigue or not. Further scientific is needed. The MOEBUS study could not establish criteria to what extent standby has to taken into account when counting cumulative duty hours. This is needed in order to meet the ER that establishes that the latest scientific and technical evidence shall be taken into account when proposing new FTL IR.

(f) 'Flight Duty Period (FDP)' means a period which commences when a crew member is required to report for duty that includes a flight or a series of flights and which finishes **when the aircraft finally comes to rest and the engines are shut down or the rotor blades are stopped, at the end of the last flight on which they are a crew member;**

Replace: a certain amount of time after the aircraft finally comes to rest and the engines are shut down or the rotor blades are stopped allowing for safety

and security related tasks to be completed, at the end of the last flight on which they are a crew member;

Reason: Even after the engines have been shut down, i.e. during disembarkation, it could become necessary to initiate an evacuation. FDP and its limitations are designed to make sure that crew members are alert to do so. All safety related tasks should be carried out during the FDP.

(i) '~~Local night~~' means a period of ~~eight hours falling between 22:00 hours and 08:00 hours~~ local time;

Replace: **ten** hours falling between 22:00 hours and **10:00**

Reason: The term 'local night' is used in the IR to establish a weekly rest period which is clearly intended to mitigate the effect of cumulative fatigue. The MOEBUS study indicates in the answer to question 10 that there is scientific evidence that shows that the effectiveness of the second night sleep (see OR.OPS.355.FTL (d) and CS FTL.1.155 (c)) is limited if the second night is followed by a duty period starting as early as 06:00.

(l) 'Positioning' means the transferring of a non-operating crew member from place to place, at the behest of the operator, excluding the time from home to a designated reporting place and vice versa, or time for local transfer from a place of rest to the commencement of duty and vice versa;

Replace: time, *limited to one hour* for local transfer from a place of rest to the commencement of duty and vice versa

Reason: The place of rest away from home base is chosen by the operator, if for any reason the operator chooses a place further away than a one hour transfer from the reporting point, the transfer time should be counted as FDP as it generates fatigue.

comment by: DGAC

Definitions of EU-OPS should be taken as is: article 22 states that substantive provisions should be transferred to the IR. If the definitions are changed, then the provisions do not have the same meaning.

For instance :

**OR.OPS.010.FTL**

(g) '*Home base*' means the location nominated by the operator to the crew member from where the crew member normally starts and ends a duty period or a series of duty periods;

differs from:

**(EU-)OPS 1.1095 - Definitions**

1.7. Home base:

*The location nominated by the operator to the crew member from where the crew member normally starts and ends a duty period or a series of duty periods and where, under normal conditions, the operator is not responsible for the accommodation of the crew member concerned.*

comment

3152

comment by: DGAC

**(f) 'Flight Duty Period (FDP)'** : This definitions makes sense as in EU-OPS only if the definition of 'series of flights' as proposed in (a)(65) of

OPS.GEN.010 (NPA 2009-02-b) is amended to delete the 'A to A' provision laid down in (ii) which does not make any sense in any of the places in the NPA where series of flights is used (always in the expression "flight or series of flights"). - See our comment on (a)(65) of OPS.GEN.010 (NPA 2009-02-b) -

**Relevant Text:**

OR.OPS.010.FTL Definitions

(b) 'Flight Time' means:

(1) (1)for aeroplanes and touring motor gliders the total time from the moment the aircraft first moves from its parking place for the purpose of taking off until the moment it finally comes to rest on the designated parking position at the end of the flight and all engines or propellers are stopped:

**Comment:**

This is a change in terminology from EU-OPS Subpart Q - OPS 1.1095 (1.2) Block Time

In UK aviation industry the term 'Flight Time' as proposed by EASA commonly refers to the total time from the moment the wheels leave the runway on takeoff until the moment the wheels touch the runway on landing.

By changing the terminology there could be considerable confusion and potential data errors in the application of FTL

**Proposal:**

Replace with terminology used in EU-OPS Subpart Q :

OPS 1.1095 1.2 Block Time

The time between an aeroplane first moving from its parking place for the purpose of taking off until it comes to rest on the designated parking position and all engines or propellers are stopped

comment by: cfdt france

#### **OR OPS 010 FTL DEFINITIONS**

(a) "Augmented flight crew means....."

**Amended text proposed : 'Augmented cabin crew' means a cabin crew complement which comprises more than the minimum number required to operate the aircraft and within which each fully qualified cabin crew member can leave their assigned post and be replaced by another appropriately qualified cabin crew member for the purpose of in-flight break;**

**JUSTIFICATION : When operating flights with in-flight break the minimum cabin crew should be on duty in order to attend in-flight emergencies appropriately.**

(c) 'Duty' means any task that a crew member is required by the operator to perform, including, for example, flight duty, administrative work, training, positioning, and standby when it is likely to induce fatigue;

**Replace: airport standby and all other forms of standby**

**JUSTIFICATION** : BR 216/2008 establishes in Art. 22 2.(a) that Initially, the implementing rules shall include all substantive provisions of Subpart Q of Annex III to Regulation (EEC) No 3922/91. In order to meet this essential requirement provisions of Subpart Q *OPS 1.1125* should be taken into account. The mentioned OPS reads:

1.2. Airport standby will count in full for the purposes of cumulative duty hours.

1.3. Where airport standby is immediately followed by a flight duty, the relationship between such airport standby and the assigned flight duty shall be defined by the Authority. In such a case, airport standby shall be added to the duty period referred to in OPS 1.1110 under points 1.1 and 1.2 for the purposes of calculating minimum rest.

1.4. Where the airport standby does not lead to assignment on a flight duty, it shall be followed at least by a rest period as regulated by the Authority.

**Leading to the conclusion that airport standby needs be followed by minimum rest because it generates fatigue.**

**Request:** AMC or GM is needed to define whether standby other than airport

standby generates fatigue or not. Further scientific is needed. The MOEBUS study could not establish criteria to what extent standby has to taken into account when counting cumulative duty hours. This is needed in order to meet the ER that establishes that the latest scientific and technical evidence shall be taken into account when proposing new FTL IR.

(f) 'Flight Duty Period (FDP)' means a period which commences when a crew member is required to report for duty that includes a flight or a series of flights and which finishes when the aircraft finally comes to rest and the engines are shut down or the rotor blades are stopped, at the end of the last flight on which they are a crew member;

**TEXT Replacement:** after the aircraft finally comes to rest and the engines are shut down or the rotor blades are stopped allowing for safety and security related tasks to be completed, at the end of the last flight on which they are a crew member and When all passengers have disembarked on commercial operations and crew duties and checks have been completed as required by the authorities and operators.

**Justification & Reason:** Even after the engines have been shut down, i.e. during disembarkation, it could become necessary to initiate an evacuation. FDP and its limitations are designed to make sure that crew members are alert to do so. All safety related tasks should be carried out during the FDP.

(g) "Home base" means the location nominated by the operator to the crew member from where the crew member normally starts & ends a duty period or series of duty periods

**Replace with the addition :** " and where the operator does not provide rest accommodation"

**Reason & JUSTIFICATION :** If left as such the operator may consider "home base" as a lay over with rest accommodation & use minimum rest periods as in Section VIII "Flight and Duty time limitations and rest requirements" CS FTL 1.155 (b). This has been suggested by the French authorities....

(i) 'Local night' means a period of eight hours falling between 22:00 hours and 08:00 hours local time;

**Replace:** ten hours falling between 22:00 hours and 10:00

**Reason:** The term 'local night' is used in the IR to establish a weekly rest period which is clearly intended to mitigate the effect of cumulative fatigue. The MOEBUS study indicates in the answer to question 10 that there is scientific evidence that shows that the effectiveness of the second night sleep (see OR.OPS.355.FTL (d) and CS FTL.1.155 (c)) is limited if the second night is followed by a duty period starting as early as 06:00.

(l) 'Positioning' means the transferring of a non-operating crew member from place to place, at the behest of the operator, excluding the time from home to a designated reporting place\* and vice versa, or time for local transfer from a place of rest to the commencement of duty and vice versa;

\***Replace by** " designated Home base" as defined by (g) in the definitions

**Reason :** If the "designated reporting place" is not the "home base" then "a place of rest" must be provided as in the latter part of this definition .

**Replace:** time, limited to one hour for local transfer from a place of rest to the commencement of duty and vice versa

**Reason:** The place of rest away from home base is chosen by the operator, if for any reason the operator chooses a place further away than a one hour transfer from the reporting point, the transfer time should be counted as FDP as it generates fatigue.

comment

comment by: cfdt france

(a) publish duty rosters sufficiently in advance to provide the opportunity for

crew members to plan adequate rest;

**Request:** What does sufficiently mean? CS should establish what sufficiently in advance means in days.

**Reason & JUSTIFICATION:** Not knowing when a crew member will be scheduled for a duty in advance is stressful and fatigue generating. Issuing CS that establishes a minimum advance allow for enough flexibility for any kind of operation.

(e) take into account the relationship between the frequencies and pattern of flight duty periods and rest periods and give consideration to the cumulative effects of undertaking long duty hours combined with minimum rest periods;

**Insert at the beginning:** "when scheduling,"

**Reason:** In order to generate a legal obligation of a precise action that shall follow the *taking into account*, this action *scheduling*, should be mentioned for more clarity.

**Request:** AMC and GM should give guidance on how this should be taken into account when scheduling.

(f) allocate duty patterns which avoid practices that cause a serious disruption of established sleep/work pattern such as alternating day/night duties;

**Supported, but the term day and night duties should be defined (see UK CAP 371).**

**Request:** AMC and GM should take up the recommendation made by MOEBUS in the answer to question 4; reporting times should not be advanced on consecutive days.

**Reason:** Sleep deprivation, especially in the WOCL, has a detrimental effect on alertness.

(h) plan local days free of duty and notify crew members sufficiently in advance;

**Request:** The advance needs to be defined in CS or AMC.

**Reason:** See reason to OR.OPS.015.FTL (a)

~~(i) provide a meal and drink opportunity in order to avoid any detriment to a crew member's performance, especially when the Flight Duty Period (FDP) exceeds six hours;~~

**Replace:** provide a 20 minute meal break for any six hours Flight Duty Period (FDP) with an additional 10 minute break for any three hours of FDP that do not contain a meal break in order to avoid any detriment to a crew member's performance;

**Reason:** Hypoglycaemia and hypo hydration are likely to occur on long duty hours and will result in increased fatigue, loss of concentration and detrimental to alertness.

(l) take action to change a schedule or crewing arrangements where the actual operation exceeds the maximum flight duty period on a significant proportion of flights in that schedule during a scheduled seasonal period.

**Replace:** arrangements, the latest

33%

**Reason:** See Art. 22 2. (a) of BR Initially, the implementing rules shall include all substantive provisions of Subpart Q of Annex III to Regulation (EEC) No 3922/91. The 33% rule should be considered a substantive provision of Subpart Q. OPS 1.1105 4. Operational Robustness 4.1. Planned schedules must allow for flights to be completed within the maximum permitted flight duty period. To assist in achieving this operators will take action to change a schedule or crewing arrangements at the latest where the actual operation exceeds the maximum FDP on more than 33% of the flights in that schedule during a scheduled seasonal period.

The proposed text in the NPA is less restrictive; the article in Subpart Q establishes an obligation and a recommendation. The operator must

**correct after concluding the season, but it reads *the latest, the operator should do this before the end of the season.***

comment by: CityJet

Proposed re-definition of 'Window of Circadian Low (WOCL)':

**'Window of Circadian Low (WOCL)' means the period between 02:00 and 05:59 hours. Within three time zones, the WOCL refers to home base time for the first 24 hours after departure from home base time zone, and to local time thereafter. Beyond three time zones the WOCL refers to home base time for the first 48 hours after departure from home base time zone and to local time thereafter.'**

This proposed re-definition, together with the introduction of an additional definition 'Acclimatised' (comment # 3220), are required to balance the FDP management for operators with home bases at the westernmost time zone in Europe.

CityJet has crew home bases at Dublin, London and Paris, and crews commence duties from one of the three bases, as well as from 8 other airports, 3 of which are in the Dublin/London time zone while the other 5 are in the Paris time zone. In the absence of provision for acclimatisation, and where WOCL is linked narrowly to a one-hour time zone, the situation can arise where crewmembers on the same Flight Duty have different end times to their local night, and therefore different allowable FDPs. Thus a Paris-based crewmember can work later than a Dublin or London based one, even though they reported together.

CityJet has continually mixed crews for reason of qualification and standardisation. This is necessary to ensure adequate familiarity for operations to CAT C airports, such as Florence and London City, which involve a high proportion of CityJet flights. It is essential that all our crews are adequately familiar with these CAT C airports and the interchanging of crews is necessary to maintain a standard greater than minimum required recency.

While the recognition of the 'Window of Circadian Low' is correctly based on empirical physiological data, there is no evidence to support the constraint of linking WOCL within a band of three time zones to home base time. A crew operating within one time zone of home base time, availing of a 'Rest period' (as defined) and able to take uninterrupted nights sleep may be considered to be acclimatised. Such crew is then physiologically ready to commence duty involving a normal FDP based on local time at the airport where duty commences.

It would be unrealistic to fail to recognise the physiological acclimatisation which actually occurs when crews travel and work, for a number of days, from a time zone which differs by one time zone from home base.

comment by: FNAM (*Fédération Nationale de l'Aviation Marchande*)

**Comment**

There is need for a global part dedicated to definitions. Moreover the definitions of OR.OPS.010.GEN can not be considered as complete as they are restricted to the subpart OPS.

**Proposal**

We suggest a specific part of the EASA regulation framework may contain a comprehensive and exhaustive list of definitions, applicable to the whole EASA regulation, which is the best way to have consistent and non-redundant definitions.

**Justification**

This might be a legal issue regarding the scope of understanding and cause problems of reading.

comment 3376 comment by: *FNAM (Fédération Nationale de l'Aviation Marchande)*

**Comment**

The definition for "home base" may be slightly modified to comply with operational requirements. For example, a crew (with home base Paris) can do London/ New York/Francfort/New York/London, but cannot do London/New York/London/New York/London. As a result base may have to be considered as stop over during a series of duty periods.

**Proposal**

The following sentence should be added to the definition: " during a series of duty periods, out of base rest rules apply, whatever the place of stopover".

**Justification**

obvious

comment by: Bristow Helicopters

Aligned with current JAR FCL definition - current JAR OPS definition of Flight Time is "From the time the helicopter first moves under its own power for the purpose of take-off until the time the rotors stop". Recording from rotor start to rotor stop will add a significant portion of recordable time to a large passenger carrying operation. This time has not been considered to impact fatigue in the past and thus is considered an unnecessary imposition on operators.

comment

3684

comment by: Bristow Helicopters

Refers to standby "if it is likely to induce fatigue. Need clearer definition of "Standby".

comment 3831 comment by: *IACA International Air Carrier Association*

(e) and (k)

Definitions are confusing. What is the difference between "assigned to duty" and "carries out their duty". EASA shall clarify why they need both definitions.

comment 3832 comment by: *IACA International Air Carrier Association*

(j)

Delete this definition, as this is only used under OR.OPS.010 Definitions, and nowhere else in this NPA.

Motivation: This is not a safety issue, but a social issue and does not belong in these requirements. Days off are already covered by the European Working Time Directive.

comment 3833 comment by: *IACA International Air Carrier Association*

(L)

Editorial: "means the transferring of a non-operating crew member from place to place, at the behest of the operator, excluding the time from home to a designated reporting place and vice versa, or **excluding** time for local transfer from a place of rest to the commencement of duty and vice versa;"

comment 3834 comment by: *IACA International Air Carrier Association*

(o)

Although definition is the same as in EU-OPS it is still unclear and leaves room for different interpretations.

Change "band of three time zones" into "three hours time difference".

EASA shall better define "departure from home base time zone": does it mean when the time zone is left or does it mean when previous FDP at home base started ?

A crew member can be en-route for 10 days from eg. AMS tot DXB to BKK to HKG to SYD to BKK to DXB. Then on departing from DXB to AMS he would have to use "home base time" after having been used to far greater time differences for the last 10 days. In fact using AMS time would enhance the negative effect of time zone crossings. The same problem appears when home base is AMS and crew member operates for 10 days in Africa. He would have to use AMS time while he is acclimatised to Africa time.

**Proposed definition:**

WOCL means the period between 02:00 hours and 05:59 hours. WOCL refers to home base time.

Beyond three **hours** time difference **AND** beyond 48 hours after departure from home base time, WOCL refers to local time.

comment 3839

comment by: *European Business Aviation Association (EBAA)*

(b) 'Flight time' means:

(1) for aeroplanes and touring motor gliders the total time from the moment the aircraft first moves from its parking place for the purpose of taking off until the moment it finally comes to rest on the designated parking position at the end of the flight and all engines or propellers are stopped;

(2) for helicopters, the total time from the moment a helicopter's rotor blades start turning until the moment the helicopter finally comes to rest at the end of the flight, and the rotor blades are stopped;

(3) for sailplanes, the total time from the moment the sailplane commences the ground run in the process of taking off until the moment it finally comes to a rest at the end of flight; and

(4) for balloons the total time from the moment the basket leaves the ground for the purpose of taking off until the moment the balloon finally comes to a rest at the end of the flight;

Subpart Q ((EC) No 1899/2006)

*Block time (subpart Q)*

*The time between an aeroplane first moving from its parking place for the purpose of taking off until it comes to rest on the designated parking position and all engines or propellers are stopped.*

Proposed changes:

For Business Aviation the proposed definition of "Flight Time" actually corresponds with the definition of "Block Time" as it does in Subpart Q. Moreover the definition of "Flight Time" is already used in Business Aviation operations and means the time between the moment an airplane first lifts off from the ground and the moment it lands. This definition is also crucial in aircraft maintenance in Business Aviation, maintenance is done "on-hard time" not "on-condition" - like air carriers do. Keeping this definition will result on a direct increase of the maintenance costs by more than 20%. For this reason Business Aviation asks to replace in the proposed definition the words "Flight Time" by the words "Block Time".

comment 3842

comment by: *European Business Aviation Association (EBAA)*

(n) 'Standby' means a defined period of time during which a crew member is required by the operator to be available to receive an assignment for a specific duty without an intervening rest period;

Proposed change:

(n) 'Aerodrome and operating site standby' means a defined period of time during which a crew member is required by the operator to be available to receive an assignment for a specific duty without an intervening rest period;

comment 3847 comment by: *European Business Aviation Association (EBAA)*

(d) 'Duty period' means a period which starts when a crew member is required by an operator to report for commencing a duty and ends when that person is free from all duties;

Comment:

This definition is too restrictive and does not fit to Business Aviation operations. The definition of "Duty period" needs to accommodate the concept of "Split duty which means, a break inside a duty. This break in a suitable accommodation shall not count for duty or rest.

comment 3886 comment by: *Air Berlin PLC & Co. Luftverkehrs KG*

Definitions (c) Duty

Wording is too imprecise. Not all standby is duty or induces fatigue. How is fatigue due to standby to be determined? Same applies to rest, where the operator also cannot assess fatigue. Perhaps EASA means "Standby duty" (OR.OPS.050.FTL), which is included in "duty" anyhow. Therefore "...and standby when is likely to induce fatigue." shall be deleted.

Definitions (n) Standby

Therefore, add new definition clearly specifying "Standby duty" means "Aerodrome/operating site standby" as used in OR.OPS.050.FTL and OR.OPS.350.FTL, e.g. "standby duty" is the only standby that is likely to induce fatigue.

Definition (e) Flight crew member and (k) Operating crew member

Definitions are confusing. What is the difference between "assigned to duty" and "carries out their duty". EASA shall clarify why they need both definitions.

Definition (j) a single day free of duty

Delete this definition, as this is only used under OR.OPS.010 Definitions, and nowhere else in this NPA.

Motivation: This is not a safety issue, but a social issue and does not belong in these requirements. Days off are already covered by the European Working Time Directive.

Definition (l) positioning

Editorial: "means the transferring of a non-operating crew member from place to place, at the behest of the operator, excluding the time from home to a designated reporting place and vice versa, or **excluding** time for local transfer from a place of rest to the commencement of duty and vice versa;"

Definition (o) Window of Circadian Low

- Although definition is the same as in EU-OPS it is still unclear and leaves room for different interpretations.
- Change "band of three time zones" into "three hours time difference".
- EASA shall better define "departure from home base time zone": does it mean when the time zone is left or does it mean when previous FDP at home base started ?
- A crew member can be en-route for 10 days from eg. AMS tot DXB to BKK to HKG to SYD to BKK to DXB. Then on departing from DXB to AMS he would have to use "home base time" after having been used to far greater time differences for the last 10 days. In fact using AMS time would enhance the negative effect of time zone crossings. The same problem appears when home base is AMS and crew member operates for 10 days in Africa. He would have to use AMS time while he is acclimatised to Africa time.

**Proposed definition:**

WOCL means the period between 02:00 hours and 05:59 hours. WOCL refers to home base time.

Beyond three **hours** time difference **AND** beyond 48 hours after departure from home base time, WOCL refers to local time.

Delete this definition, as this is only used under OR.OPS.010 Definitions, and nowhere else in this NPA.

Motivation: This is not a safety issue, but a social issue and does not belong in these requirements. Days off are already covered by the European Working Time Directive.

Editorial: "means the transferring of a non-operating crew member from place to place, at the behest of the operator, excluding the time from home to a designated reporting place and vice versa, or **excluding** time for local transfer from a place of rest to the commencement of duty and vice versa;"

Although definition is the same as in EU-OPS it is still unclear and leaves room for different interpretations.

Change "band of three time zones" into "three hours time difference".

EASA shall better define "departure from home base time zone": does it mean when the time zone is left or does it mean when previous FDP at home base started ?

(a)

Add:

'Augmented cabin crew' means a cabin crew compliment which comprises more than the minimum number required to operate the aircraft and within which each fully qualified cabin crew member can leave their assigned post and be replaced by another appropriately qualified cabin crew member for the purpose of in-flight break;

Reason: When operating flights with in-flight break the minimum cabin crew should be on duty in order to attend in-flight emergencies appropriately.

comment

comment by: CUD

(c) 'Duty' means any task that a crew member is required by the operator to perform, including, for example, flight duty, administrative work, training, positioning, ~~and standby when it is likely to induce fatigue;~~

Replace: airport standby and all other forms of standby

Reason: The MOEBUS study in its answer to question 15 establishes that sleep taken on standby is shorter and of poorer quality and therefore induces fatigue. Moreover, BR 216/2008 establishes in Art. 22 2.(a) that Initially, the implementing rules shall include all substantive provisions of Subpart Q of Annex III to Regulation (EEC) No 3922/91. In order to meet this essential requirement provisions of Subpart Q *OPS 1.1125* should be taken into account. The mentioned OPS read:

1.2. Airport standby will count in full for the purposes of cumulative duty hours.

1.3. Where airport standby is immediately followed by a flight duty, the relationship between such airport standby and the assigned flight duty shall be defined by the Authority. In such a case, airport standby shall be added to the duty period referred to in OPS 1.1110 under points 1.1 and 1.2 for the purposes of calculating minimum rest.

1.4. Where the airport standby does not lead to assignment on a flight duty, it shall be followed at least by a rest period as regulated by the Authority.

Leading to the conclusion that airport standby needs be followed by minimum rest because it generates fatigue.

Request: CS, AMC or GM is needed to define to what extent standby other than airport standby generates fatigue. The MOEBUS study in its answer to question 15 reports that sleep taken is shorter and of poorer quality. They propose a sliding scale and call for further scientific research. This is in line with the requirements of Art 19, 2. of Regulation 216/2008.

comment by: CUD

(f) 'Flight Duty Period (FDP)' means a period which commences when a crew member is required to report for duty that includes a flight or a series of flights and which finishes ~~when the aircraft finally comes to rest and the engines are shut down or the rotor blades are stopped, at the end of the last flight on which they are a crew member;~~

Replace: When all passengers have disembarked on commercial operations and crew duties and checks have been completed as required by the authorities and operators;

Reason: Even after the engines have been shut down, i.e. during disembarkation, it could become necessary to initiate an evacuation. FDP and its limitations are designed to make sure that crew members are alert to do so. All safety related tasks should be carried out during the FDP.

comment

3978

comment by: CUD

(i) 'Local night' means a period of ~~eight hours falling between 22:00 hours and 08:00 hours local time;~~

Replace: **ten** hours falling between 22:00 hours and **10:00**

Reason: The term 'local night' is used in the IR to establish a weekly rest period which is clearly intended to mitigate the effect of cumulative fatigue. The MOEBUS study indicates in the answer to question 10 that there is scientific evidence that shows that the effectiveness of the second night sleep (see OR.OPS.355.FTL (d) and CS FTL.1.155 (c)) is limited if the second night is followed by a duty period starting as early as 06:00.

comment

3979

comment by: CUD

(l) 'Positioning' means the transferring of a non-operating crew member from place to place, at the behest of the operator, excluding the time from home to ~~a designated reporting place~~ and vice versa, or time for local transfer from a place of rest to the commencement of duty and vice versa;

Replace: their designated home base as defined in (g) OR.OPS.010.FTL

Reason: The home base is the designated reporting place after resting at home.

**C. III. Draft Opinion Part-OR - Subpart OPS - Section VIII - Chapter 1 -  
OR.OPS.015.FTL Operator responsibilities**

p. 25-26

comment 4

comment by: AIR SAFETY GROUP

**OR.OPS.015FTL Operator Responsibility.**

1. **Suggest delete "wh ere applic able t o th e type of oper ation".**  
Note: This phrase is superfluous. The operator shall (a), (b) etc is all that is needed.
2. **(a) ...."sufficiently in advanc e".** Note: This is a meaningless statement unless a figure, such as 14 days, is included. Obviously 'in advance' can, technically, mean anything from 5 minutes to whatever...! A crew member could, for example, be told just before going off duty before midnight that they are to start a Day off in 5 minutes time. Custom and practice suggests that the publishing of rosters normally gives at least 14 days prior notice and covers a 28 day or monthly period. Suggest this be included.
3. **(c) "sufficiently free from fatigue".** Note: Suggest delete the word 'sufficiently' as being purely subjective and unquantifiable. Crew members should remain free from fatigue at all times, that is the whole essence and point of having an FTL Scheme. They will become tired, obviously, towards the end of the FDP but should never reach the stage of being fatigued.
4. **(d) Suggest insert "all pre-flight" ground duties.**
5. **(f) Suggest add at the end of sentence "consecutive early, late or night flights and crossing of time zones"**
6. **(g) Suggest change 'duties' to 'duty' and change 'following' to 'next'.** Note: If 'duties' are included, it begs the question as to how many previous duties have to be taken into account and how that can possibly be achieved. The key is to ensure adequate rest is provided to recover from the previous duty prior to the next FDP.
7. **(h) Without mentioning a specific number of days prior notice of Days Off (sug gest mini mum of 14 da ys notice as per normal rostering practices), the ph rase 'su fficiently in advance' coul d mean, technically, anything from 5 minutes onwards!**
8. **(I) Two phras es ar e used h ere, 'significant proportion' and 'scheduled season al peri od' neither o f which ar e de fined and may be interpreted in vastly di fferent ways. Suggest a percentage figure be inclu ded for 'si gnificant proportion' - ideally 5%. In ot her words, the pl anning s hould be real istic enough never to have to use Commander's discretion other than on rare occasions. No s uggestions for 'scheduled seasonal period' ot her than it should be defined precisely within each operator's FTL Scheme.**

 Comment on OR.OPS.015.FTL: delete as follows:  
 An operator shall, ~~where applicable to the type of operation:~~  
 Justification:  
 "..., where applicable to the type of operation" shall be deleted. All of these items are hard requirements.
- comment 1078 comment by: *ECA - European Cockpit Association*  
 Comment on OR.OPS.015.FTL (d):  
 Clarification needed that the reporting time has to allow for all applicable ground duties to be performed.

comment 1079 comment by: ECA - European Cockpit Association

Comment on OR.OPS.015.FTL (e): change as follows:

take into account the relationship between the frequencies and pattern of flight duty periods and rest periods and give **full** consideration to the cumulative effects of undertaking long duty hours combined with minimum rest periods;

Justification:  
The text substitutes the former wording "...give consideration" for "*Operators shall be expected to appreciate ...*" which is an improvement but which is still too weak. The fatiguing effect of cumulative duty is typically underestimated; the expression "full consideration" should at least be used.

Moebus : ... in the absence of further research, night freight operations beyond current limits should only be permitted if supported by a suitable FRMS.

comment 1080 comment by: ECA - European Cockpit Association

Comment on OR.OPS.015.FTL(f):

This provision needs to be reworked in line with latest scientific evidence. Guidelines must be developed to limit the impact of disrupted sleep patterns on flight safety.

So far the scientific evaluation recommends:

(a) night duties and duties that encompass the WOCL are limited to 10 hours.  
(b) the number of consecutive duties starting or ending in the WOCL should be limited.  
(c) extending the definition of early starts to FDPs commencing before 07:00.  
(d) start time of consecutive early morning duties shall be rolling backwards (i.e. start later) rather than forwards.

comment 1081 comment by: ECA - European Cockpit Association

Comment on OR.OPS.015.FTL (h): changes as follows:

... plan local days free of duty and notify crew members sufficiently in advance; **the notification periods shall reflect the operators need for flexibility as well as the crew members need for planning stability. Local days free of duty shall be marked as such in the individual schedule and once notified may only be changed upon the crew member's assent unless this would expose significant scheduling difficulties in case of unforeseen operational circumstances like an unscheduled delayed return to home base.**

Justification:  
A clarification is required for the term "sufficiently in advance". Since "local days free of duty" derive from Minimum European Social Standards (see CD 2000/79/EC) these days reflect the need for the planning of a social life and eventually its impact on flight safety. Especially the absence of a minimal balanced social background will eventually become a significant burden with an intolerable negative impact on flight safety.

comment 1082 comment by: ECA - European Cockpit Association

Comment on OR.OPS.015.FTL(i):change as follows:

provide a meal and drink opportunity in order to avoid any detriment to a crew member's performance, especially when the Flight Duty Period (FDP) exceeds six hours; **during FDPs with multiple sectors and short block and ground times individual ground times may have to be extended to meet the physiological demand.**

Justification:

The scientific evaluation states:

To meet the need for adequate sustenance and to avoid dehydration as well as to provide occasional interruption from periods of continuous work for cabin crew a meal-break of 30 minutes in a six hour period should be provided.

comment 1083 comment by: ECA - European Cockpit Association

Comment on OR.OPS.015.FTL (k): change as follows:

ensure that flights are planned to be completed within the allowable flight duty period taking into account the time necessary for preflight duties, the flight and turn-around times **and where applicable all safety related duties at the end of the flight after on block;**

Justification:

Safety related duties after on block must be included under the fatigue aspect; for further information see comments under OR.OPS.010.FTL Definitions (f).

comment 1084 comment by: ECA - European Cockpit Association

Comment on OR.OPS.015.FTL(l): change as follows:

take action to change a schedule or crewing arrangements where the actual operation exceeds the maximum flight duty period on a significant proportion of flights **in a way that indicates that further exceeding is likely to be expected. in that schedule during a scheduled seasonal period.**

Justification:

As a "scheduled seasonal period" often last for half a year this regulation is extremely retroactive. When the seasonal period is over, the schedule is typically changed. Thus the wording as given would explicitly allow an intentionally unfit planning for a scheduling season. Therefore action should be taken at the latest after it becomes obvious that further exceeding is likely to occur; this could be as soon as one month after any initial indication for exceeding the maximum FDP.

comment 1085 comment by: ECA - European Cockpit Association

Comment on OR.OPS.015.FTL: add new paragraph (m):

**(m) not require a crew member to operate an aeroplane if the crew member declares that he is or suspects to be fatigued to the extent that the safety of the flight may be adversely affected.**

Justification:

It is an operator's responsibility to impede fatigued crews to operate an aeroplane.

comment

1090

comment by: AEA

**Relevant Text:** OR.OPS.015 FTL Operator Responsibilities

**Comment:** Fatigue and FTL are a joint responsibility of the operator and crew concerned. Therefore the crew responsibilities should be in hard law (implementing rules) as is the case today in EU-OPS (Regulation (EC) 1899/2006) rather than EASA proposal to downgrade the crew responsibilities to guidance material

**Proposal:** modify as follows

OR.OPS.015 Operator **and Crew** Responsibilities

....

(m) A crew member shall not operate an aeroplane if he/she knows that he/she is suffering from or is likely to suffer from fatigue or feels unfit, to the extent that the flight might be endangered

(n) Crew Members should make optimum use of the opportunities and facilities for rest provided and plan and use their rest periods properly

comment

1192

comment by: Sven Freisenich

**FTL Operator responsibilities**

Fatigue and FTL are joint responsibilities of operator and crew. While crew responsibilities are in hard law in EU-OPS 1.085, the EASA proposal downgraded the crew responsibilities to GM (GM OP.OPS.025.FTL – FRMS and GM OR.OPS.325.TFL – FRMS).

Change title to "Operator and Crew Responsibilities" and add:

(m) A crew member shall not operate an aeroplane if he/she knows that he/she is suffering from or is likely to suffer from fatigue or feels unfit, to the extent that the flight might be endangered.

(n) Crew members shall plan and make optimum use of the opportunities and facilities for rest provided.

**FTL Operator responsibilities (b)**

Change "12 calendar months" by "one calendar year".

Additionally: home base changes in excess of 4 times in any calendar year can be mutually agreed between operator and crew member.

comment

comment by: UK CAA

**Page No:** 25

**Paragraph No:** OR.OPS.015.FTL (i)

**Comment:** This "meal and drink opportunity" requirement (albeit very similar to that published in SubPart Q of EU-OPS) is slightly confusing. Does the rule always require a meal and drink opportunity to be provided no matter how short the FDP? Does the rule require an opportunity to be provided **only** when

the FDP exceeds 6 hours? Finally, is the FDP in question the planned FDP or the actual FDP on the day?

The proposed text assumes that a drink opportunity during any FDP is important, in addition it has assumed that the "meal opportunity" is applicable to any FDPs in excess of 6 hours (not just FDPs planned to be over 6 hours). The proposed text in parentheses could be omitted from the rule as it is not of itself a rule but an explanation of a rule and should more properly be included in AMC or GM.

**Justification:** Clarity.

**Proposed Text (if applicable):**

(o) provide a drink opportunity in any planned FDP and for a meal and drink opportunity in FDPs in excess of 6 hours (in order to avoid detriment to a crew member's performance).

1739

comment by: *Jill Pelan*

**OR.OPS.015.FTL Operator responsibilities**

(a) publish duty rosters **sufficiently in advance** to provide the opportunity for crew members to plan adequate rest;

**CFDT FRANCE UNION & ETF Request:** What does sufficiently mean? CS should establish what sufficiently in advance means in days.

Reason: Not knowing when a crew member will be scheduled for a duty in advance is stress and fatigue generating. Issuing CS that establish a minimum advance allow for enough flexibility for any kind of operation.

(e) take into account the relationship between the frequencies and pattern of flight duty periods and rest periods and give consideration to the cumulative effects of undertaking long duty hours combined with minimum rest periods;

**The C FDT & ETF demand an Insert at the beginning:** "*when scheduling....*".

Reason: In order to generate a legal obligation of a precise action that shall

follow the *taking into account*, this action *scheduling*, should be mentioned for more clarity.

Request: AMC and GM should give guidance on how this should be taken into account when scheduling.

(f) allocate duty patterns which avoid practices that cause a serious disruption of established sleep/work pattern such as alternating day/night duties;

**Supported by CFDT and ETF**, but the term day and night duties should be defined (see UK CAP 371).

Request: AMC and GM should take up the recommendation made by MOEBUS in the answer to question 4; reporting times should not be advanced on consecutive days.

Reason: Sleep deprivation, especially in the WOCL, has a detrimental effect on alertness.

(h) plan local days free of duty and notify crew members sufficiently in advance;

**Request CFDT France & ETF:** "The advance" needs to be defined in CS or AMC.

Reason: See reason OR.OPS.015.FTL (a)

~~(i) provide a meal and drink opportunity in order to avoid any detriment to a crew member's performance, especially when the Flight Duty Period (FDP) exceeds six hours;~~

Replace: provide a 20 minute meal break for any six hours Flight Duty Period (FDP) with an additional 10 minute break for any three hours of FDP that do not contain a meal break in order to avoid any detriment to a crew member's performance;

Reason: **Hypoglycaemia** and hypo hydration are likely to occur on long duty hours and will result in increased fatigue, loss of concentration and detrimental to alertness.

~~(l) take action to change a schedule or crewing arrangements where the actual operation exceeds the maximum flight duty period on a significant proportion of flights in that schedule during a scheduled seasonal period.~~

**The CFDT & ETF Crew demand** Replacement : arrangements, the latest and 33% of flights instead of " a significant proportion"

Reason: **In order to achieve operational robustness operators should be encouraged to take action as soon as possible and not only after for the next seasonal period.** See Art. 22 2. (a) of BR Initially, the implementing rules shall include all substantive provisions of Subpart Q of Annex III to Regulation (EEC) No 3922/91. The 33% rule should be considered a substantive provision of Subpart Q. *OPS 1.1105* 4. Operational Robustness 4.1. Planned schedules must allow for flights to be completed within the maximum permitted flight duty period. To assist in achieving this operators will take action to change a schedule or crewing arrangements **at the latest** where the actual operation

exceeds the maximum FDP on more than 33 % of the flights in that schedule during a scheduled seasonal period.  
 The proposed text in the NPA is less restrictive; the article in Subpart Q establishes an obligation and a recommendation. The operator must correct after concluding the season, but it reads *the latest*, the operator should do this before the end of the season.

**Page: 25 Section: OR.OPS.015.FTL Operator Responsibilities**

Relevant Text: OR.OPS.015 FTL Operator Responsibilities

**Comment:** Fatigue and FTL are a joint responsibility of the operator and crew concerned. Therefore the crew responsibilities should be in hard law (implementing rules) as is the case today in EU-OPS (Regulation (EC) 1899/2006) rather than EASA proposal to downgrade the crew responsibilities to guidance material

Proposal: OR.OPS.015 Operator and Crew Responsibilities

....

(m) A crew member shall not operate an aeroplane if he/she knows that he/she is suffering from or is likely to suffer from fatigue or feels unfit, to the extent that the flight might be endangered

(n) Crew Members should make optimum use of the opportunities and facilities for rest provided and plan and use their rest periods properly

(a) publish duty rosters sufficiently in advance to provide the opportunity for crew members to plan adequate rest;

**Request:** What does sufficiently mean? CS should establish what sufficiently in advance means in days.

**Reason:** Not knowing when a crew member will be scheduled for a duty in

advance is stress and fatigue generating. Issuing CS that establish a minimum advance allow for enough flexibility for any kind of operation.

(e) take into account the relationship between the frequencies and pattern of flight duty periods and rest periods and give consideration to the cumulative effects of undertaking long duty hours combined with minimum rest periods;

**Insert** at the beginning: *when scheduling,*

Reason: In order to generate a legal obligation of a precise action that shall follow the *taking into account*, this action *scheduling*, should be mentioned for more clarity.

**Request:** AMC and GM should give guidance on how this should be taken into account when scheduling.

(f) allocate duty patterns which avoid practices that cause a serious disruption of established sleep/work pattern such as alternating day/night duties;

Supported, but the term day and night duties should be defined (see UK CAP 371).

**Request:** AMC and GM should take up the recommendation made by MOEBUS in the answer to question 4; reporting times should not be advanced on consecutive days.

Reason: Sleep deprivation, especially in the WOCL, has a detrimental effect on alertness.

(h) plan local days free of duty and notify crew members sufficiently in advance;

**Request:** The advance needs to be defined in CS or AMC.

Reason: See reason to OR.OPS.015.FTL (a)

~~(i) provide a meal and drink opportunity in order to avoid any detriment to a crew member's performance, especially when the Flight Duty Period (FDP) exceeds six hours;~~

**Replace:** provide a 20 minute meal break for any six hours Flight Duty Period (FDP) with an additional 10 minute break for any three hours of FDP that do not contain a meal break in order to avoid any detriment to a crew member's performance;

Reason: Hypoglycaemia and hypo hydration are likely to occur on long duty hours and will result in increased fatigue, loss of concentration and detrimental to alertness.

(l) take action to change a schedule or crewing arrangements where the actual operation exceeds the maximum flight duty period on a significant proportion of flights in that schedule during a scheduled seasonal period.

**Replace:** arrangements, the latest 33%

Reason: In order to achieve operational robustness operators should be

encouraged to take action as soon as possible and not only after for the next seasonal period. See Art. 22 2. (a) of BR Initially, the implementing rules shall include all substantive provisions of Subpart Q of Annex III to Regulation (EEC) No 3922/91. The 33% rule should be considered a substantive provision of Subpart Q. OPS 1.1105 4. Operational Robustness 4.1. Planned schedules must allow for flights to be completed within the maximum permitted flight duty period. To assist in achieving this operators will take action to change a schedule or crewing arrangements **at the latest** where the actual operation exceeds the maximum FDP on more than 33 % of the flights in that schedule during a scheduled seasonal period.

The proposed text in the NPA is less restrictive; the article in Subpart Q establishes an obligation and a recommendation. The operator must correct after concluding the season, but it reads *the latest*, the operator should do this before the end of the season

The wording and scope of these requirements may be suitable for a commercial operator but are completely out of scope for a non-commercial one-man operator of a complex aircraft who might not even operate the aircraft for business but purely for pleasure.

In this case words and concepts such as duty rosters, reporting times, duty patterns etc. are completely inappropriate.

Either the applicability should only be for commercial operators or the regulation should be modified so that it fits the whole area of applicability including the one-man non-commercial operator who operates a complex aircraft privately for his own pleasure.

Section (a) - The word "sufficiently" is too vague - a stronger description is required.

Section (b) - See our comments on AMC OR.OPS.015.FTL NOMINATION OF A HOME BASE.

Section (c) - "sufficiently free from fatigue" - Who will define this? We also suggest using "an adequate level of alertness" rather than "a satisfactory level of safety" to enhance the intent.

Section (d) - We feel this sentence is open to interpretation and that the following adjusted text from EUOPS Subpart Q section OPS 1.1105 (1.2) should be used. "An operator shall specify reporting times that realistically reflect the time for all pre-flight safety related ground duties"

Section (e) - This section is too lax in its' content and is open to interpretation. Changing "..give consideration.." to "..are required to fully appreciate.." would alleviate our concerns.

Section (f) - This should be bolstered with a reference to using the available scientific data and identifying poor practices through the operators FRMS.

Section (g) - Again, a reference to the use of data extracted from the operators FRMS should be highlighted regarding this area.

Section (h) - Our point highlighted in Section (a) is valid again here. The phrase "...sufficiently in advance;" is too open to interpretation. We would suggest a minimum of 14 days notice would be acceptable.

Section (i) - Three points here:

1) The word "opportunity" is too vague - It doesn't specify whether the operator will supply sustenance during this time which we believe is the intention.

2) The word "must" has been omitted which was in Subpart Q. This needs to be reinstated.

3) We expect that the scientific answer to question 17, published in the Moebus Review, will be incorporated into this section.

Section (k) - There is no definition of the word "planned". This is very open to interpretation.

Section (l) - There are no guidelines as to how often this data will be interrogated or acted upon. For example, addressing the issue at the end of a scheduled series will be too late to react! See comments in AMC OR.OPS.015 FTL (l).

comment 2740 comment by: *Civil Aviation Authority of Norway*

The phrasing; "where applicable etc", should be removed.

comment 2748 comment by: *Civil Aviation Authority of Norway*

Comment to subsection (a): The time period "in advance" should be specified. We suggest two weeks should as a norm.

comment 2749 comment by: *Civil Aviation Authority of Norway*

Comment to subsection (h): The time period "in advance" should be specified. We suggest two weeks as a norm. Directive EC /2000/79 states a requirement for a number of days at home base, and this should be taken into this Ops.

**OR.OPS.015.FTL**

**Operators responsibility**

(i)

The assignment to "Operators responsibility" and the change of wording from "A meal and drink opportunity must occur" (OPS 1.1130 Nutrition) to "Operators responsibility : provide a meal and drink opportunity..." may lead to a different interpretation of the operators responsibility for nutrition.

It might even encourage demands for food and drink "to provide" by the operator.

Reason: In order to generate a legal obligation of a precise action that shall follow the *taking into account*, this action *scheduling*, should be mentioned for more clarity.

Request: AMC and GM should give guidance on how this should be taken into account when scheduling.

(f) allocate duty patterns which avoid practices that cause a serious disruption of established sleep/work pattern such as alternating day/night duties;

**Supported by CFDT and ETF**, but the term day and night duties should be defined (see UK CAP 371).

Request: AMC and GM should take up the recommendation made by MOEBUS in the answer to question 4; reporting times should not be advanced on consecutive days.

Reason: Sleep deprivation, especially in the WOCL, has a detrimental effect on alertness.

(h) plan local days free of duty and notify crew members sufficiently in advance;

**Request CFTD France & ETF:** "The advance" needs to be defined in CS or AMC.

Reason: See reason OR.OPS.015.FTL (a)

~~(i) provide a meal and drink opportunity in order to avoid any detriment to a crew member's performance, especially when the Flight Duty Period (FDP) exceeds six hours;~~

Replace: provide a 20 minute meal break for any six hours Flight Duty Period (FDP) with an additional 10 minute break for any three hours of FDP that do not contain a meal break in order to avoid any detriment to a crew member's performance;

Reason: **Hypoglycaemia** and hypo hydration are likely to occur on long duty hours and will result in increased fatigue, loss of concentration and detrimental to alertness.

(l) take action to change a schedule or crewing arrangements where the actual operation exceeds the maximum flight duty period on a ~~significant proportion~~ of flights in that schedule during a scheduled seasonal period.

**The CFTD & ETF Crew demand** Replacement : arrangements, the latest and 33% of flights instead of " a significant proportion"

Reason: See Art. 22 2. (a) of BR Initially, the implementing rules shall include all substantive provisions of Subpart Q of Annex III to Regulation (EEC) No 3922/91. The 33% rule should be considered a substantive provision of Subpart Q. *OPS 1.1105* 4. Operational Robustness 4.1. Planned schedules must allow for flights to be completed within the maximum permitted flight duty period. To assist in achieving this operators will take action to change a schedule or crewing arrangements **at the latest** where the actual operation exceeds the maximum FDP on more than 33 % of the flights in that schedule during a scheduled seasonal period.

The proposed text in the NPA is less restrictive; the article in Subpart Q establishes an obligation and a recommendation. The operator must correct after concluding the season, but it reads *the latest*, the operator should do this before the end of the season.

Change the word 'flight time' to 'block time'

**OR.OPS.020.FTL (b)****Comment**

This requirement gives no protection to the Operator and would facilitate crew members in moving from one operator to another without fulfilling their contractual obligations. There is no basis in safety for this requirement.

**Proposal**

Revert to EU-OPS wording as specified in 1.1135 1. (c)

".....Copies of these records will be made available to the crew member upon request"

comment 456

comment by: *Condor Flugdienst GmbH - FRA HO/R*

**"Functions for more than one operator..."** Acc. to Condor Flugdienst GmbH, it is to be doubted that any operator is able to fulfill this requirement. The responsibility to keep records on flight, duty and rest times carried out for another operator can not be located with the operator. This responsibility has to be addressed with the regarding CM.

**"Reports by the pilot in command on extended flight duty periods...":** EASA shall confirm this article refers only to commanders discretion of a flight duty period.

comment 544

comment by: *SCCA Scandinavian Cabin Crew Association*

Records should be kept for a longer period than 15 months. 24 months are more sufficient for an accurate understanding of possible long term fatigue. This is to facilitate investigations of incidents and accidents.

comment 719

comment by: *Luftfahrt-Bundesamt*

The LBA does not agree to move EU-OPS in a CS, due to its legal uncertainty, even when the Basic Regulation asks for a CS.

We herewith request to establish a clear legal situation by keeping the FTL – Requirements in the Implementing Rules.

The FTL rules as proposed do not include requirements for corporate operations with non-complex motor powered aircraft. This is not acceptable as pilots of these aircraft deserve the same protection against fatigue as their colleagues in larger aircraft.

Justification: see LBA - General Comment, reasons 1 and 2

comment 1086

comment by: *ECA - European Cockpit Association*

Comment on OR.OPS.020.FTL(b) (1):

This text is duplicated in OR.OPS.320.FTL (a), but as a contradiction all records shall be kept for 15 months, not only those mentioned in (iii). These regulations should be consolidated and merged.

## Justification:

All crew members and especially the commander are required to meet the limitations of their TL scheme at all times. Thus records must be made available in a way which allows the crew member to assess the present status especially in regards to accumulated limits.

To make these records available just upon request will typically fall short of the individual crew member's tasks as well as of the commander's responsibility.

comment 1092 comment by: ECA - European Cockpit Association

Comment on OR.OPS.020.FTL(b) (1) ii: change as follows:

Start, duration and end of each duty **and or** flight duty period;

## Justification:

Both concepts must be included.

comment 1094 comment by: ECA - European Cockpit Association

Comment on OR.OPS.020.FTL(b) (3):

Text duplicated in OR.OPS.320.FTL (b); these regulations should be consolidated and merged.

comment 1095 comment by: ECA - European Cockpit Association

Comment on OR.OPS.020.FTL(c)(b):

The bullet points should be marked (1) and (2), not (a) and (b). New text added in (b) give enhanced security for compliance with FTL limits as records also shall be provided directly between operators.

comment 1195 comment by: Sven Freisenich

It has to be clear that it remains the responsibility of the individual crew member to monitor its individual cumulative flight/duty times and rest times. It can never be the responsibility of the operator what a crew member does elsewhere, including what the crew member is doing during rest time. See also comments under OR.OPS.015.FTL

What are extended flight hours ?

EASA shall confirm this refers to extended flight duty periods at the discretion of the pilot-in-command (OR.OPS.035.FTL(b)).

comment 1296 comment by: UK CAA

**Page No:** 26

**Paragraph No:** OR.OPS.020.FTL (c)

**Comment:** It is suggested that the operator should be required in this rule to also provide (upon request) these records to the competent authority.

**Justification:** The competent authority should also have immediate access to these records.

**Proposed Text (if applicable):**  
Add "(c) to the competent authority "

comment 2069 comment by: *IAOPA Europe*

How is it expected that a one-man non-commercial operator of a complex aircraft who only uses his aircraft for recreational purposes should define and record duty time and rest periods? When is he on duty and when is he off duty if he flies only for his own private pleasure? The concept of duty and rest period does not make sense in this context.

Either the applicability should be changed or the rules must be written so they fit all kinds of operations for which they apply.

comment 2752 comment by: *Civil Aviation Authority of Norway*

Comment to subsection (b) (3): 6 mnd for such reports seems too short and could make it problematic to get information on trends and for statistic. We suggest that the reports instead should be kept for at least 15 months.

comment 2756 comment by: *BALPA*

We agree with the content in this section

comment 2824 comment by: *Deutsche Lufthansa AG*

**Relevant text:**

Functions for more than one operator.

**Comment:**

The proposal significantly deviates from the EU-OPS principle by transferring the responsibility to keep ALL records from the crew member to the operator.

**Proposal:**

Re-align with EU-OPS 1.1135:

2. If the records held by the operator under paragraph 1 do not cover all of his/her flight duty, duty and rest periods, the crew member concerned shall maintain an individual record of his/her:

(a) block times;

(b) start, duration and end of each duty or flight duty periods; and

(c) rest periods and days free of all duties.

3. A crew member shall present his/her records on request to any operator who employs his/her services before he/she commences a flight duty period.

comment 2825 comment by: *Deutsche Lufthansa AG*

(b)(3) Reports by the pilot in command ...

**Comment:**

PIC and Commander are not the same, as commented at relevant places on crew responsibilities.

**Proposal:**  
re-align to EU OPS wording:  
(b)(3) Reports by the Commander ...

comment

3154

comment by: DGAC

Employees who work for different operators and operators which employ those personnel have the responsibility to inform the respective operators of their schedule.

However due to the expected difficulty to integrate in time or even to develop schedule in advance, safety will be impacted since the operator will not be able to manage the fatigue of their crew under FRMS. The impact on fatigue of planned operator schedule cannot be determined and countermeasures cannot be implemented.

comment

3601

comment by: Civil Aviation Authority Finland

*Comment and proposal:*

There should be also requirements, how the operator shall handle flight, duty and rest period records, rostering and supervision of the FDT restrictions ensuring that, a crew member, who same time is flying for two or more operators or working as flight instructor for some commercial training organization, remains free from fatigue to operate safely for the operator.

The combined hours of flight, duty and rest times must be recorded, calculated and followed.

Of course the pilot has the final responsibility not to fly when feeling himself fatigue, but the operator must have the knowledge (records) and is responsible to ensure that his crew member stays under the limits given in the requirements.

*Justification:*

Only mentioning in OR.OPS.020.FTL (c) another operator to whom the operator upon request shall provide copies of individual records is not enough, because the other operator may not know, that the pilot is working for that operator, too.

We know several pilots, who are on side the main job as airline pilot flying part time for some smaller operator or as instructor for flying school. We have found some cases, when the combined flight and duty times have been much over the restrictions.

**Aihe:** RE: Procedural question

Dear Mr Kivinen,

Sorry for taking so much time to answer your question due to the important

workload the last weeks.

I'm coming back to you specially in case your colleague Reijo Lamberg hasn't informed you on this topic yet.

As explained, we analysed carefully your question with EASA and discussed it with the Member States during the meeting of the Air Safety Committee that took place on 24.10.2008, where the following conclusions were drawn:

3.2. OPS 1.1100 and 1.1135- Pilots flying as instructors and for commercial transport: total block times and cumulative duty hours. It was agreed that EU-OPS obligations do not fully ensure reporting and taking into account Flight Duty Periods (FDPs), duty periods and block times spent in separate air activities conducted by the same crew member. Where pilots conduct flights outside the commercial transport activity of EU-OPS, or even work for more than one operator, this practice could lead to exceeding the maximum limits contained in OPS 1.1100. Most members agreed that private flying activities create less concern than commercial ones. Not all Member States (MSs) address this issue. The Commission concluded that this matter will be addressed through the future IRs based on the EASA Regulation 216/2008. It was agreed that the practice established by Finland did not constitute a derogation to EU-OPS and therefore did not require a notification to the Commission in accordance with article 8(1).

In summary, we fully support the need to clarify the obligations contained under your circular letter of 12 August 2008 within EU-OPS, but consider that a notification according to Article 8(1) is not necessary. EASA will include clearer obligations on the forthcoming NPA on OPS, which publication is foreseen on 30 January 2009.

I hope this responds to your questions and remain at your disposal for any other query.

I also wish you Merry Christmas and an Excellent 2009!

## Reference:

Regulation (EC) No 1899/2006 of the European Parliament and of the Council of 12 December 2006, Article 1, para 10) (amending Article 8 of Regulation EEC No 3922/91), especially the text: "If the safety problem results from an inadequate level of safety provided for by the common technical requirements and administrative procedures . . .".

Dear Ms Hernandez-Antunez,

The Finnish Civil Aviation Authority has with a circular letter of 12 August 2008 to commercial air transport operators determined that in case of the same person working for flight training requiring a permit as an instructor in a flight school (except sport aviation clubs) and, on the other hand, as a flight crew member in commercial air transport, the flight and duty times of both tasks shall be summarized and the total of these be restricted as follows:

1. Limits on total block times
  - a) 100 block hours in any 28 consecutive days
  - b) 900 block hours in a calendar year.
2. Limits on cumulative duty hours
  - a) 190 duty hours in any 28 consecutive days
  - b) 2000 duty hours in a calendar year.

This is to maintain an adequate level of safety, by ensuring that crew members remain sufficiently free from fatigue to operate an aircraft safely in commercial air transport, despite of their demanding work as flight instructors in commercial flight schools.

Now we would like to ask if this measure is of such kind that it necessitates informing the Commission and the other Member States officially, according to the Regulation (EC) No 1899/2006.

Yours sincerely

Whilst it is accepted that the operator should utilise a system of recording Flight Time and Duty records that offers simple portability we feel that there should be a greater onus on the individual to provide this information to a new operator, rather than the onus being on the operator. The 'old' operator can only provide information that has been provided by the individual and so may not have the Onus should be on individual not operator

We herewith request to establish a clear legal situation by keeping the FTL – Requirements in the Implementing Rules.

The FTL rules as proposed do not include requirements for corporate operations with non-complex motor powered aircraft. This is not acceptable as pilots of these aircraft deserve the same protection against fatigue as their colleagues in larger aircraft.

Justification: see LBA - General Comment, reasons 1 and 2

comment 1093 comment by: *AEA*

**Relevant Text:**

(a) An operator shall establish, implementing and maintain an FRMS as an integral part of its management system. The FRMS shall ensure that the safety objectives of the Essential Requirements are met

(b) The FRMS shall be adapted to manage the operational risk of the operator arising from crew member fatigue

(c) The FRMS shall correspond to the roster system or flight time specification scheme used by the operator in accordance with OR.OPS.230.FTL or OR.OPS.330.FTL

(d) The operator shall require that crew members report any instance if they are fatigued and that safety may be affected

(e) The operator shall take mitigating safety measures when the FRMS process shows that required safety performance is not maintained

**Comment:**

A Fatigue Risk Management System, as under discussion at ICAO, is deemed as a tool to provide additional flexibility for specific operations (e.g. Ultra Long Range Operations) and shall therefore only be mandatory, when a flight scheme is proposed to operate beyond the approved FTL limitations but should not become a mandatory requirement for all airlines/flights in addition to prescriptive schemes (such as Subpart Q) as proposed by EASA. It should remain at the individual operators' discretion to implement FRMS for his entire operation. EASA's proposal would lead to huge organizational cost and will lead to social discussions for questionable safety benefits. We therefore urge EASA to stick to Subpart Q of EU-OPS.

In addition, there should not be a separate management system for fatigue since fatigue is only one input to the airline Safety Management System (SMS) along other potential safety hazards. As part of the SMS, crew member can already today report any instance that may endanger safety and the operator is already required to take mitigating safety measures.

The AEA would like to point out that there has, however, not been any safety accident or incidents involving EU airlines where fatigue has been the cause. It therefore seems rather strange to give fatigue a different level of priority and separate management system than the approach taken for more important safety hazards (bird strikes, ATC related hazards, runway incursions etc)

As explained above, there should not be a requirement for using the SMS when the airline operator has an individual Flight Time Limitation Scheme which remains within the boundaries of Subpart Q of EU-OPS (Regulation (EC) 1899/2006). FTL schemes which comply with EU-OPS have proven to be safe based on decades of safe operational experience. The SMS should only be used when an operator wants to go beyond the limits of the current Subpart Q of EU-OPS.

**Proposal:** Delete current text of OR.OPS.025 FTL Fatigue Risk Management Systems (FRMS) and replace it with

*OR.OPS.025.FTL Fatigue Risk Management*

*(a) An operator shall establish flight and duty time limitations and rest scheme (FTL) for crew members with the aim to manage fatigue risk*

*(b) An operator shall ensure that for all its flights, the flight and duty time limitations and rest scheme are in accordance with an approved individual Flight and Duty Time Limitation (FTL) scheme. All individual FTL schemes as initially accepted for compliance with Subpart Q of Regulation (EC) 1899/2006 are considered as an approved FTL scheme for this purpose.*

*(c) The Authority may grant an individual operator the authorisation to deviate from an approved FTL scheme as referred to in (b), provided that the operator - using operational experience and output from its safety management system – can demonstrate to the Authority that its request for a variation produces an equivalent level of safety.*

Comment on OR.OPS.025.FTL(b): change as follows:

The FRMS shall be adapted to manage the operational risk(s) of the operator **arising from crew member fatigue, comprising a comprehensive range of procedures which are both scientifically based and data-driven, allowing a cooperative and flexible means of managing crew member fatigue.**

Justification:

FRMS must include the latest conclusions derived from scientific knowledge. Therefore being the FRMS part of the operator's Management System, it should be based on a data-driven procedures.

Comment on OR.OPS.025.FTL:

(a) An operator shall establish, implement and maintain an FRMS as an integral part of its **safety** management system. The FRMS shall ensure that the safety objectives of the Essential Requirements are met.

Justification:  
This important clarification is required, in line with ICAO wording.

comment 1100 comment by: *ECA - European Cockpit Association*

Comment on OR.OPS.025.FTL(d):

The operator shall require that crew members report any instance if they **know they are** are fatigued and that safety may be affected. **Appropriate training must be provided by the operator.**

Justification:

Crews are no fatigue specialists, they may not always realise in time they are fatigued. Crews can only report this when they are sufficiently aware of the fatigue.

comment 1102 comment by: *ECA - European Cockpit Association*

Comment on OR.OPS.025.FTL(e): Further explanation is needed to identify the "required safety performance".

comment 1196 comment by: *Sven Freisenich*

Stakeholders cannot properly comment to proposed ICAO FRMS document, as this will only be adopted later this year and is not available to stakeholders.

The current EU-OPS FTL schemes are proven safe based on decades of operational experience. Operators consider fatigue as an input to the airline's Safety Management System (SMS), along with other potential safety hazards such as bird strikes, ATC related hazards, runway incursions...There should not be a separate management system for fatigue. Crew members can already report any event that may endanger flight safety and the operators are required to take mitigating actions under that SMS.

Add new paragraph: **OR.OPS.025.FTL Fatigue Risk Management**

(a) (f) The Competent Authority may grant an individual operator the authorisation to deviate from an approved FTL scheme, provided that the operator - using operational experience and output from its safety management system - can demonstrate to the Competent Authority that its request for a variation produces an equivalent level of safety.

comment 1563 comment by: *British Airways*

The proposal to require a Fatigue Risk Management System (FRMS) will lead to endless social tension/discussions and huge costs for the airlines whereas it does not reflect the fact that FRMS is only proposed (as draft) by ICAO for specific type of flights (i.e.. Ultra Long Range Flights - currently not operated by EU airlines) that go beyond the limits of prescriptive FTL schemes such as Subpart Q of EU-OPS. Whether or not to implement an FRMS should therefore remain an individual airline's decision to get additional flexibility for specific flights.

Our proposal would be to remove the whole section and replace with:

**OR.OPS.025.FTL Fatigue Risk management**

- (a) An operator shall establish Flight and duty time Limitations and rest Scheme (FTL) for crew members with the aim to manage Fatigue Risk.
- (b) An operator shall ensure that for all its flights, the Flight and Duty time Limitations and rest Scheme are in accordance with an approved individual Flight and Duty Time limitation (FTL) Scheme. All individual FTL Schemes as initially accepted for compliance for Sub Part Q of regulation (EC) 1899/2006 is considered as an approved FTL Scheme for this purpose.
- (c) The Authority may grant an individual operator the authorisation to deviate from an approved FTL Scheme as referred to in (b), provided the operator – using operational experience and output from its Safety Management System – can demonstrate to the Authority that its request for a variation produces an equivalent level of safety.

comment by: Jill Pelan

**OR.OPS.025.FTL Fatigue Risk Management System (FRMS)**

**GENERAL CFDT COMMENT**: THE FRMS remains a vague conception for many of us (authorities, unions, associations, personnel..) How exactly does a FRMS "ensure" safety? Also "Mitigating safety measures" seem to lack precision.

CS material has to conform to the FRMS which remains a mystery system ---

**this is a reason that leads the CFDT to ask for all FTL provisions to be hard rule material - IR's.**

(d) The operator shall require that crew members report any instance if they are fatigued and that safety may be affected.

CFDT FRANCE Comment: This puts too much responsibility on individuals. The identity of reporting individuals must be protected.

**THE CFDT France demands Repl acement & additi on** : "crew members have the right to refuse flight duty when suffering from fatigue of such a nature that they feel they may not be able to safely continue duties. This should not be contested by operators or authorities."

**Reason** : ICAO Annexe 6- 2.3.2. "an important safeguard may be established if states and operators recognise the right of a crew member to refuse further flight duty when suffering from fatigue of such a nature as to adversely affect the safety of flight"

French legislation : Decree of 11 July 1991 relative to fatigue of crew members:

"A crew member must abstain from duty if she/he feels any type of deficiency that leads Him/her to believe that she/he may not have the necessary aptitude to exercise his/her duties".

comment by: Tyrolean Airways

*The mentioned FRMS was - in our opinion - recommended / proposed by ICAO for specific type of flights, such as ultralong range flights. Requiring an airline to have a FRMS implemented on top of the existing FTL scheme DOES NOT MAKE ANY SENSE TO US. There will be tremendous tension on the airline in dealing with unions when this is implemented.*

*Implementation of subpart Q streamlined very much amongst the airlines and already moved towards less productivity and - viewed by those crewmembers being out there in the daily ops - was not always to the advantage of the crews. Going a step further will actually decrease satisfaction of crewmembers, make them less productive, force them to commute to their place of living and - in the end - putting the on the edge of legality.*

*We would highly recommend to have Subpart Q as it is topped with clearer definitions and transitions this into hard law.*

(b) The FRMS shall be adapted to manage the operational risk of the operator arising from crew member fatigue

(c) The FRMS shall correspond to the roster system or flight time specification scheme used by the operator in accordance with OR.OPS.230.FTL or OR.OPS.330.FTL

(d) The operator shall require that crew members report any instance if they are fatigued and that safety may be affected

(e) The operator shall take mitigating safety measures when the FRMS process shows that required safety performance is not maintained

**Comment:**

A Fatigue Risk Management System, as under discussion at ICAO, is deemed as a tool to provide additional flexibility for specific operations (e.g. Ultra Long Range Operations) and shall therefore only be mandatory, when a flight scheme is proposed to operate beyond the approved FTL limitations but should not become a mandatory requirement for all airlines/flights in addition to prescriptive schemes (such as Subpart Q) as proposed by EASA. It should remain at the individual operators' discretion to implement FRMS for his entire operation. EASA's proposal would lead to huge organizational cost and will lead to social discussions for questionable safety benefits. We therefore urge EASA to stick to Subpart Q of EU-OPS.

In addition, there should not be a separate management system for fatigue since fatigue is only one input to the airline Safety Management System (SMS) along other potential safety hazards. As part of the SMS, crew member can

already today report any instance that may endanger safety and the operator is already required to take mitigating safety measures.

The AEA would like to point out that there has, however, not been any safety accident or incidents involving EU airlines where fatigue has been the cause. It therefore seems rather strange to give fatigue a different level of priority and separate management system than the approach taken for more important safety hazards (bird strikes, ATC related hazards, runway incursions etc)

As explained above, there should not be a requirement for using the SMS when the airline operator has an individual Flight Time Limitation Scheme which remains within the boundaries of Subpart Q of EU-OPS (Regulation (EC) 1899/2006). FTL schemes which comply with EU-OPS have proven to be safe based on decades of safe operational experience. The SMS should only be used when an operator wants to go beyond the limits of the current Subpart Q of EU-OPS.

**Proposal:** Delete current text of OR.OPS.025 FTL Fatigue Risk Management Systems (FRMS) and replace it with

*OR.OPS.025.FTL Fatigue Risk Management*

(a) *An operator shall establish flight and duty time limitations and rest scheme (FTL) for crew members with the aim to manage fatigue risk*

(b) *An operator shall ensure that for all its flights, the flight and duty time limitations and rest scheme are in accordance with an approved individual Flight and Duty Time Limitation (FTL) scheme. All individual FTL schemes as initially accepted for compliance with Subpart Q of Regulation (EC) 1899/2006 are considered as an approved FTL scheme for this purpose.*

(c) *The Authority may grant an individual operator the authorisation to deviate from an approved FTL scheme as referred to in (b), provided that the operator - using operational experience and output from its safety management system – can demonstrate to the Authority that its request for a variation produces an equivalent level of safety.*

**European Regions Airline Association Comment**

Stakeholders cannot properly comment to proposed ICAO FRMS document, as this will only be adopted later this year and is not available to stakeholders. Hence, it will be difficult to have an effective and workable FRMS in place prior to 8 April 2012. Many operators will have difficulty collecting relevant scientific and medical expertise.

FRMS should only be required for operations deviating from the established FTL requirements. This is exactly what FRMS are designed for, therefore, EASA should propose to ICAO that the EASA Implementing Rules satisfy the requirements of FRMS, but FRMS should only be mandated for operations deviating from the Implementing Rules.

comment by: *Lufthansa CityLine GmbH***Proposal:**

Delete Fatigue Risk Management System (FRMS) as part of FTL and transfer the philosophy as Fatigue Risk Management ~~System~~ (FRM) as part of SMS to the respective AMC of OR GEN 200  
(The respective FTL AMC / GM is affected in the same way)

**Note:**

The isolated description of an Fatigue Risk Management **System** (FRMS) is understood as an separate system, additional to the Safety Management System, it is not understood as a part of the SMS.

**Explanatory statement:**

Fatigue Risk Management is part of a general safety management system (SMS). Due to that it should not only be limited to FTL. The management of fatigue is necessary in different areas of an airline operation (e.g. MX, ATC, Dispatch, etc.)

**Relating to FTL:**

Fatigue Risk Management is necessary in particular by using a different (alternate) FTL-scheme than the one known from Subpart Q (or equivalent).

**Explanation:**

The ICAO-requirement for the implementation of an SMS is in our understanding, an organisation-wide approach to manage safety. The flight safety- or rather the accident prevention and flight safety program as known under EU-OPS 1.037 / JAR.OPS 3.037 is part and an initial basis of this SMS.

comment by: *DGAC*

DGAC contributed to the development of FRMS through its participation in the ICAO Fatigue Risk Management Sub-Group (FRMSG) of the OPS panel. It was the group consensus that FRMS should be implemented by educated operators only. Because of the complexity of the scientific knowledge and analysis methodologies required (as noted in the proposed OR.OPS), FRMS should be implemented for specific issues (e.g. ultra long range flights).

Therefore we strongly recommend limiting FRMS to operators that need a flexible roster for a limited number of cases, i.e. ultra long range, reduced rests, and/or slip duty. The existing FRMS that have been scientifically validated are focused on specific issues (ULR, specific schedule, reduced rests or split duty). There is no scientific feedback from States or operators (i.e. New Zealand) implementing an FRMS for all operations. Nevertheless it is known that some operators rely on recognised high level scientific resources to monitor their FRMS.

Fatigue as a risk may or may not be identified under the Management System (part OR.GEN.200). When an operator has identified fatigue as a risk then the obvious countermeasure is to implement an FRMS. Operators that implement CS.FTL should not be required to implement FRMS.

Requiring FRMS for all operators will unduly increase costs to operators that implement CS.FTL and might give rise to a non effective and non harmonised FRMS for operators that do not have the resources to establish and maintain a good quality FRMS. The burden to the authority will also unduly increase.

Therefore it is proposed to amend the paragraph requiring a FRMS accordingly

comment by: DGAC

**(d) : Proposal:** delete OR.OPS.025.FTL (d)

**Justification:** it is stated in (d) that "The operator shall require that crew members report any instance if they are fatigued and that safety may be affected". However this case does not fall under mandatory incident/event reporting. The operator must not be put in a position to require such report. The ICAO FRMS places reporting of fatigue cases under the Crew Member Responsibility. This is done on purpose pertaining to the variable nature of perceived fatigue as well as complexity to assess its potential impact on flight safety.

The operator responsibility is limited to the implementation of an FRMS as stated in GM OR.OPS.325.FTL that comprises (e) a crew fatigue reporting process.

"GM OR.OPS.025.FTL / GM OR.OPS.325.FTL - 3.2 The crew member's responsibilities" already addresses the responsibility of the crew regarding reporting.

It is not clear who is responsible for assessing the applicability or suitability of a FRMS for a specific operator, or how this is done.

Due to the small size of our company, the type of operations performed (test and ferry flights) and taking into consideration the wide variety of aircraft operated by our company, the different equipment fits for each of those aircraft, the extreme short period of time those aircraft are operated, and the fact that the majority of our crews are employed on a contract per flight basis, establishing a FRMS is potentially a time-consuming and costly process.

Add: (f) Crew members shall the right to refuse flight duty when suffering from fatigue of such a nature that they feel they may not be able to safely continue duties. Their decision shall not be contested by operators or authorities.

Reason: ICAO Annexe 6- 2.3.2. reads: "an important safeguard may be established if states and operators recognise the right of a crew member to refuse further flight duty when suffering from fatigue of such a nature as to adversely affect the safety of flight". This ICAO recommendation is reflected in Annex IV 7.f. of Regulation 216/2008 and should therefore be reflected in the thereof emanating IR. Furthermore French and Spanish CAA have this principle enshrined in their FTL Rules:

French Decree of 11 July 1991 relative to fatigue of crew members:

"A crew member must abstain from duty if she/he feels any type of deficiency that leads Him/her to believe that she/he may not have the necessary aptitude to exercise his/her duties".

The Spanish CIRCULAR OPERATIVA 16 B SOBRE LIMITACIONES DE TIEMPO DE VUELO, MÁXIMOS DE ACTIVIDAD AÉREA Y PERIODOS MÍNIMOS DE DESCANSO PARA LAS TRIPULACIONES reads in its paragraph 2.: No obstante lo que se establece en estas normas, un Tripulante no volará, ni su Empresa le exigirá que lo haga, si aquel o ésta tienen razones bien fundadas para creer que el Tripulante está padeciendo fatiga excesiva o, teniendo en cuenta las circunstancias del vuelo particular que debe llevarse a cabo, es probable que llegue a acumular fatiga excesiva durante el mismo.

Regarding "The operator shall establish procedures..."

According to Condor Flugdienst GmbH, the variety of unforeseen, "special circumstances" is too huge to cope every special case. If wanted so, please issue such exact and comprehensible guidelines!

comment

493

comment by: *CityJet*

**'(b) The operator shall establish procedures to provide for an Extended FDP (Split Duty) where an FDP consists of two or more sectors separated by less than the defined minimum rest period'.**

The provision of an Extended FDP, with appropriate conditions and safeguards, is an intrinsic part of Flight Time Schemes currently in use under EU-OPS. It is an essential element of the range of rule-sets used particularly by operators serving routes requiring early morning and late evening services on many more routes than there are crew bases.

To fit the proposed numbering sequence of the content of Chapter 1, Section VIII, the "Extended FDP (Split Duty)" consideration would best be numbered and titled as follows:

**"OR.OPS.030.FTL Extended Flight Duty Period (FDP) - Split Duty"**

In this case, the proposed wording above would be (a), and the existing section "OR.OPS.035.FTL Flight Duty Period (FDP)" would be unaltered.

Where the increase of a FDP or a reduction of a rest period exceeds one hour, the operator shall send a copy of the report, together with its comments, to the competent authority, no later than 28 days after the event.

**The CFDT France UNION & ETF** asks for the Replacement with : "discretion, and after consultation with the crew members affected"

& an Addition at the end: "A copy of this report shall be made available to all affected crew members"

Reason: The consultation process enshrined in hard law in point (a) of the same OPS and recommended in the related CS should be mandatory and not only a CS to provide legal certainty and therefore a level playing field for all operators and NAAs.

As a principle and to guarantee transparency all affected crew members should be aware of the reasons given by the pilot-in-command when increasing the FDP or reducing rest on their discretion.

**Relevant Text:**

(b) The operator shall require that the pilot-in-command submit a report whenever a FDP is increased by their discretion, or when a rest period is reduced in actual operation. Where the increase of a FDP or a reduction of a rest period exceeds one hour, the operator shall send a copy of the report, together with its comments, to the competent authority, no later than 28 days after the event.

**Comment:**

Under current UK CAA requirements, where the increase of a FDP or a reduction of a rest period exceeds two hours, the operator shall send a copy of the report, together with its comments, to the competent authority, no

later than 28 days after the event. By decreasing this exception from two hours to one hour there would be an increase in the administrative burden placed on the operator which in turn will have a detrimental financial impact (increase in costs to cover the administrative requirements). In addition, Virgin Atlantic believes this proposed reduction from two hours to one hour is unnecessary on safety grounds as it will not provide any further safety oversight that is not already covered by an effective SMS (inclusive of a FRMS).

**Proposed Text:**

Increase tolerance from 1 to 2 hours and replace existing text as follows:

(b) The operator shall require that the pilot-in-command submit a report whenever a FDP is increased by their discretion, or when a rest period is reduced in actual operation. Where the increase of a FDP or a reduction of a rest period exceeds two hours, the operator shall send a copy of the report, together with its comments, to the competent authority, no later than 28 days after the event.

comment 459

comment by: *Condor Flugdienst GmbH - FRA HO/R*

**"Total flight time in any 12 consecutive calendar months":**

Condor, a german charter airline and "holiday carrier" highly depending on seasonal effects, e.g. peak during summer season. "The one calendar year" as in EU OPS reduces the problem at the end of a calendar year, e.g. in winter low season. The equal distribution of total flight time to "12 consecutive calendar month" as proposed by this NPA seems to limit the ability of any carrier to neglect seasonal effects through out a year. The entrepreneurial freedom is limited to an extent where flight safety is not impaired if i.e. July 2008 flight time have to be considered when assigning June 2009 duties. Although the working time directive considers 96 free days in one calendar year.

comment 548

comment by: *SCCA Scandinavian Cabin Crew Association*

Additional limits at 14 days at 100 hours. This to ensure that operators will spread dutyperiods as evenly as possible.

comment 722

comment by: *Luftfahrt-Bundesamt*

The LBA does not agree to move EU-OPS in a CS, due to its legal uncertainty, even when the Basic Regulation asks for a CS.

We herewith request to establish a clear legal situation by keeping the FTL – Requirements in the Implementing Rules.

The FTL rules as proposed do not include requirements for corporate operations with non-complex motor powered aircraft. This is not acceptable as pilots of these aircraft deserve the same protection against fatigue as their colleagues in larger aircraft.

Justification: see LBA - General Comment, reasons 1 and 2

comment 1097

comment by: *AEA*

**Relevant Text:**

(b) the total flight time of the flights on which an individual crew member is assigned as an operating crew member, spread as evenly as practicable

throughout their respective period:

- (1) in any 28 consecutive days and
- (2) In any 12 consecutive calendar months

**Comment:**

The EASA proposal is in contradiction and more restrictive than the EU Working Time Directive (WTD) (Council Directive 2000/79/EC of 27 November) which has set a limit of 900 hours in 1 calendar year and provides for more flexibility in particular when planning crew member yearly leave.

EASA's referring to ICAO cannot be accepted as a valid justification taking into account the fact that ICAO is not setting any limit which means that most non-EU airlines can already today do much more block flying hours than EU airlines which are faced with the 900h limit.

In addition, there is no safety justification to further restrict the current WTD limit. There is already requirement to evenly distribute the duty hours,

**Proposal:**

Replace OR.OPS.040. FTL (b) (2) with '**in 1 calendar year**'

comment

1104

comment by: ECA - European Cockpit Association

Comment on OR.OPS.040.FTL:change as follows:

Flight and duty time limitations and rest requirements shall specify the following elements of flight times and duty periods, ~~where applicable to the type of operation:~~

Justification:

How could this requirement not be applicable?

An operator may understand the wording as an indication for a non-compulsory requirement.

comment

1111

comment by: ECA - European Cockpit Association

Comment on OR.OPS.040.FTL(a):change as follows:

(a) The total duty periods to which a crew member is assigned **shall be limited, spread as evenly as practicable throughout their respective period:**

- (1) in any seven consecutive days;
- (2) in any 14 consecutive days; and**
- ~~(2)~~ **(3) in any 28 consecutive days;**

**Beyond these periods the duty periods shall be spread as evenly as practicable.**

Justification:

The application of the requirement "... spread as evenly as practical" to a period of 7 days undermines the requirements intended long term balancing effect. Due to its serious short term impact the restriction is likely to be softened just as we find it in AMC OR.OPS.040.FTL, which states that the total

duty periods and the total flight times ... "...should be spread as evenly as practicable throughout their respective period".

Therefore, AMC OR.OPS.040.FTL (a) shall be reworded accordingly and AMC OR.OPS.040.FTL (b) shall be deleted.

Further it shall be noted that the scientific evaluation recommends setting an additional restriction at 14 consecutive days.

Finally, according to Directive 2003/88/EC Article 6 the maximum number of working hours per week is 48 for a normal worker. The Working time Directive (Directive 2000/79/EC) sets a maximum annual working time of 2000 hours "... spread as evenly as practicable." This means that the "standard" working week should not exceed 42h. Therefore, exceeding the 42 hours should be exceptional and duly justified and shall never pass the 48 hour limit. Additionally a 14 day limit should be introduced.

comment

1114

comment by: ECA - European Cockpit Association

Comment on OR.OPS.040.FTL (b): add text as follows:

**When a crew member is required to report for in advance of the stipulated report time for a scheduled flight, to carry out a task at the behest of the company, then the time spent on that task shall be part of the subsequent FDP.**

Justification:

Mixed duties are not sufficiently addressed.

Where an operator must provide limits for a single flight duty period no limits are given for a combination of non- flying duties allocated immediately prior to a flight duty. The rules for the allocation of a rest would not prevent an operator from scheduling general duties in between a rest period and the subsequent flight duty.

Thus the total length of the combined duties is practically unlimited.

To limit combined duties the fatiguing effect of general duties and flight duties must be considered equal. Thus general duties allocated immediately prior to a flight duty must be limited under the flight duty limit.

comment

1205

comment by: Sven Freisenich

Replace „any 12 consecutive calendar months“ by „one calendar year“ i.a.w. Subpart Q of EU-OPS Q.

The "900 hours in any 12 consecutive months" are not specified by ICAO and is more restrictive than the EU Working Time Directive EC 2000/79 Clause 8:

"Without prejudice to Clause 3, mobile staff in civil aviation shall be given days free of all duty and standby, which are notified in advance, as follows:

- a) at least seven local days in each calendar month, which may include any rest periods required by law; and
- b) at least 96 local days in each calendar year, which may include any rest periods required by law.

The Working Time Directive regulates the 4 weeks holidays on a yearly basis, not on any 12 consecutive months. Hence, it is possible to have two times 4 weeks in 12 consecutive months, where it would not be appropriate to fly 900

hours. Otherwise, one could have no holidays and should be allowed to fly more than 900 hours in these 12 consecutive months. Changing from calendar year to 12 consecutive months implies a complete change of all systems...

LTU is highly subject to seasonal effects, e.g. peak during summer season. The "one calendar year" as in EU-OPS and Working Time Directive (Council Directive 2000/79/EC) reduces the problem to a one-time exercise at the end of the calendar year, i.e. in the winter low season. The EASA proposed "12 consecutive months" presents however an unnecessary continuing exercise, also during the summer peak, without any safety benefit and which will lead to reduced flexibility in particular when planning crew members' leave.

Note that this summer peak is not driven by the operator, but by the market itself, e.g. hard working families and tax payers going on well deserved summer holidays.

Finally, Certification Specification CS FTL.1.140 (a) and (b)(1) will avoid any intended abuse of the "one calendar year". The intent is already covered by 1.140 (c).

comment

1299

comment by: UK CAA

**Page No:** 27

**Paragraph No:** OR.OPS.040.FTL (a)(2)

**Comment:** It is suggested that a 14 day period be also added to the timescales.

**Justification:** Unless there is an additional 14 day period there is the possibility that an operator could compress the maximum allowed duty in to as little as 21 days declaring that "it was not practicable in the circumstances to spread the duty evenly."

**Proposed Text (if applicable):**

Change (a)(2) to read:

(2) in any 14 consecutive days;

(3) in any 28 consecutive days;

comment

1471

comment by: M Wilson-NetJets

**Original text:**

OR.OPS.040.FTL Flight times and duty periods

Flight and duty time limitations and rest requirements shall specify the following elements of flight times and duty periods, where applicable to the type of operation:

(a) The total duty periods to which a crew member is assigned, spread as evenly as practicable throughout their respective period:

(1) in any seven consecutive days; and

(2) in any 28 consecutive days;

(b) The total flight time of the flights on which an individual crew member is assigned as an operating crew member, spread as evenly as practicable throughout their respective period:

(1) in any 28 consecutive days; and

(2) in any 12 consecutive calendar months.

**Suggested new text:**

OR.OPS.040.FTL Flight times and duty periods

The operator shall ensure that flight and duty time limitations have maximum limits over predefined periods, expressed in periods of consecutive days, to ensure that there is accumulation of fatigue that could result in a operating crewmember endangering the safety of the flight.

**Comment/suggestion:**

Limitations that specifically address nominal limitations should be in an cs or AMC and not the IR (as per EASA and the European Commission). Different types of operations require different limits to ensure the safety of the flight. Many operations built up duty and flight time in different patterns and provide different mitigating measures to alleviate cumulative fatigue. Therefore, future FTL schemes should be allowed to limit the accumulation of fatigue, which endangers flight safety, in different quantities and time periods. It is suggested to move the actual limitations to the CS or AMC.

comment 1566

comment by: *British Airways*

Insections (a) And (b) Remove the words 'spread as evenly as practicable throughout their respective period'.

The use of this sentence is too broad as the use of the word practicable can be interpreted in too many ways. Other rules, such as days off rules should ensure that the work is evenly spread.

**Relevant Text:**

(b) the total flight time of the flights on which an individual crew member is assigned as an operating crew member, spread as evenly as practicable throughout their respective period:

- (1) in any 28 consecutive days and
- (2) In any 12 consecutive calendar months

**Comment:**

The EASA proposal is in contradiction and more restrictive than the EU Working Time Directive (WTD) (Council Directive 2000/79/EC of 27 November) which has set a limit of 900 hours in 1 calendar year and provides for more flexibility in particular when planning crew member yearly leave.

EASA's referring to ICAO cannot be accepted as a valid justification taking into account the fact that ICAO is not setting any limit which means that most non-EU airlines can already today do much more block flying hours than EU airlines which are faced with the 900h limit.

In addition, there is no safety justification to further restrict the current WTD limit. There is already requirement to evenly distribute the duty hours,

**Proposal:**

Replace OR.OPS.040. FTL (b) (2) with '**in 1 calendar year**'

comment 1742

comment by: *Jill Pelan*

**OR.OPS.040.FTL Flight times and duty periods**

~~(a) The total duty periods to which a crew member is assigned, spread as evenly as practicable throughout their respective period:~~

~~(1) in any seven consecutive days; and~~

~~(2) in any 28 consecutive days;~~

~~(b) The total flight time of the flights on which an individual crew member is assigned as an operating crew member, spread as evenly as practicable throughout their respective period:~~

~~(1) in any 28 consecutive days; and~~

~~(2) in any 12 consecutive calendar months.~~

**The CFDT France , Member of ETF** asks for the following :

Replace with : (a) The total duty periods to which a crew member is assigned, spread as evenly as *possible* throughout their respective period:

(1) *60 hours* in any seven consecutive days; and

(2) *180 hours* in any 28 consecutive days;

(b) The total flight time of the flights on which an individual crew member is assigned as an operating crew member, spread as evenly as *possible* throughout their respective period:

(1) *100 hours* in any 28 consecutive days; and

(2) *900 hours* in any 12 consecutive calendar months.

**Reason:** The word practicable leads to the conclusion that this only should be done where no additional cost is generated. The present OPS is intended to avoid cumulative fatigue and increase flight safety. Operators should be encouraged to do everything **possible** within their operational limits to comply with this.

Art. 22 2. (a) **BR establishes that substantive provisions of Subpart Q should be included in IR. The total amount of duty and flight hours must be considered a substantive provision.**

With regard to the proposed (a)(2), The MOEBUS study suggests in the answer to question 1 that there is not enough scientific evidence to support precise values, further scientific studies should be undertaken to recommend a precise value. In the meanwhile the recommendation of 180 hours should be followed.

comment by: *BALPA*

The Moebus report indicates that a 14-day duty hour limit should be set - we concur with this view. This would, in effect, also help operators "spread (work) as evenly as practicable" as stated in this section.

Please define "..spread as evenly as practicable.."

We feel that a maximum number of duty hours per 12 consecutive calendar months should also be incorporated in this section or is this area covered in the Council Directive 2000/79/EC concerning the European Agreement on the Organisation of Working Time of Mobile Workers in Civil Aviation?

27

**OPS 045 FTL**

comment 3600 comment by: ECA - European Cockpit Association

Comment: change title as follows:

OR.OPS.040.FTL Flight **and duty** times **limitations and rest requirements and duty periods**

comment 3609 comment by: ECA - European Cockpit Association

Comment:

The change from EU OPS has been noted: restricting the annual block flying hours '900 block hours per 12 consecutive calendar months' rather than 'per calendar year'. ECA fully supports this change.

comment 3645 comment by: AIR FRANCE

Relevant Text:

(b) the total flight time of the flights on which an individual crew member is assigned as an operating crew member, spread as evenly as practicable throughout their respective period:

(1) in any 28 consecutive days and

(2) In any 12 consecutive calendar months

Comment:

The EASA proposal is in contradiction and more restrictive than the EU Working Time Directive (WTD) (Council Directive 2000/79/EC of 27 November) which has set a limit of 900 hours in 1 calendar year and provides for more flexibility in particular when planning crew member yearly leave.

EASA's referring to ICAO cannot be accepted as a valid justification taking into account the fact that ICAO is not setting any limit which means that most non-EU airlines can already today do much more block flying hours than EU airlines which are faced with the 900h limit.

In addition, there is no safety justification to further restrict the current WTD limit. There is already requirement to evenly distribute the duty hours,

Proposal:

Replace OR.OPS.040. FTL (b) (2) with 'in 1 calendar year'

comment 3690 comment by: Bristow Helicopters

In line with current UK practice, this requirement should be expanded to reference 3 day , 7 day and consecutive 28 day periods

comment

3691

comment by: *Bristow Helicopters*

We suggest that there is a requirement for Absolute limits to be set for cumulative Flying Duty and Duty over various periods (suggest 28 and 90 days) and there to be a requirement for Absolute limits to be adhered to.

comment

3876

comment by: *Southern Cross International*

Due to the type of operations of our company (test and ferry flights), their infrequent nature and taking into consideration the wide variety of aircraft operated by our company, the different equipment fits for each of those aircraft, the extreme short period of time those aircraft are operated, and the fact that the majority of our crews are employed on a contract per flight basis, it is not possible to specify the total duty periods and total flight time in advance, and therefore it is not possible to spread these out over any period.

comment

3897

comment by: *Air Berlin PLC & Co. Luftverkehrs KG*

Replace „any 12 consecutive calendar months“ by „one calendar year“ i.a.w. Subpart Q of EU-OPS Q.

The “900 hours in any 12 consecutive months” are not specified by ICAO and is more restrictive than the EU Working Time Directive EC 2000/79 Clause 8:

“Without prejudice to Clause 3, mobile staff in civil aviation shall be given days free of all duty and standby, which are notified in advance, as follows:

a) at least seven local days in each calendar month, which may include any rest periods required by law; and

b) at least 96 local days in each calendar year, which may include any rest periods required by law.

The Working Time Directive regulates the 4 weeks holidays on a yearly basis, not on any 12 consecutive months. Hence, it is possible to have two times 4 weeks in 12 consecutive months, where it would not be appropriate to fly 900 hours. Otherwise, one could have no holidays and should be allowed to fly more than 900 hours in these 12 consecutive months. Changing from calendar year to 12 consecutive months implies a complete change of all systems...

LTU is highly subject to seasonal effects, e.g. peak during summer season. The “one calendar year” as in EU-OPS and Working Time Directive (Council Directive 2000/79/EC) reduces the problem to a one-time exercise at the end of the calendar year, i.e. in the winter low season. The EASA proposed “12 consecutive months” presents however an unnecessary continuing exercise, also during the summer peak, without any safety benefit and which will lead to reduced flexibility in particular when planning crew members’ leave.

Note that this summer peak is not driven by the operator, but by the market itself, e.g. hard working families and tax payers going on well deserved summer holidays.

Finally, Certification Specification CS FTL.1.140 (a) and (b)(1) will avoid any intended abuse of the “one calendar year”. The intent is already covered by 1.140 (c).

- (2) *900 hours* in any 12 consecutive calendar months.

Reason: The word practicable leads to the conclusion that this only should be

done where no additional cost is generated. The present OPS is intended to avoid cumulative fatigue and increase flight safety. Operators should be encouraged to do everything **possible** within their operational limits to comply with this.

Art. 22 2. (a) BR establishes that substantive provisions of Subpart Q should be included in IR. The total **amount** of duty and flight hours must be considered a substantive provision.

With regard to the proposed (a)(2), The MOEBUS study suggests in the answer to question 1 that there is not enough scientific evidence to support precise values, further scientific studies should be undertaken to recommend a precise value. In the meanwhile the recommendation of 180 hours should be followed.

comment 4058

comment by: *Tyrolean Airways*

EU OPS Subpart Q did refer to "..in a calendar month", whereas OR.OPS.050.FTL refers to a rolling period. Subpart Q already reduced plannable duty times for crews. Now further reductions will result as of this change.

**Original text:**

OR.OPS.045.FTL Positioning duty

Where operators assign crew members to positioning duty, the following shall apply, taking into account the type of operation:

- (a) Positioning after reporting but prior to operating shall be included as part of the FDP but shall not count as a sector;
- (b) All of the time spent positioning shall count as duty time and shall be taken into account for the calculation of the minimum rest period.

**Suggested new text:**

R.OPS.045.FTL Positioning duty

Where operators assign crew members to positioning duty, the following shall apply, taking into account the type of operation:

- (a) Positioning after reporting but prior to operating shall be included as part of the FDP but shall not count as a sector;
- (b) All of the time spent positioning shall be factored towards duty time and shall be taken into account for the calculation of the minimum rest period;
- (c) When determining the factor that positioning is counted towards the FDP and/or rest period the following shall be taken into account:**
  - (i) The active involvement of the crew member in the positioning**
  - (ii) Possibility to rest during the positioning**
  - (iii) Physical impact of the positioning and its effect on fatigue.**

**Comment/suggestion:**

Positioning is counted fully towards duty but different modes of positioning lead to different levels of fatigue. Positioning as self-drive-car leads to much more fatigue than a first class airline or positioning as a single passenger on a

business jet where, in both occasions, you can rest comfortably in a bed. Therefore, a provision should be added to allow for different types and modes of positioning and allow for a factor, equal to the amount of fatigue that is accumulated during that positioning, toward rest requirements and maximum duty and flight duty limitations.

 OR.OPS.050.FTL Standby duty**

p. 27

comment 339 comment by: *REGA*  
 HEMS needs special regulations:  
 REGA operates for many decades using the same schema and policy of e.g. "standby duty requirements" for their crew members (HCM/DOCTORS). Thru those decades the management and the crew member themselves experienced very positive results regarding flight safety, health and work-live-balance aspects.  
 Due to the organization and the comfortable accommodation of each HEMS operating base, during standby duty crew members have the opportunity to relax (according at least OR.OPS.050.FTL).

comment 372 comment by: *Reto Ruesch*

(d) Comment: Airport standby is fully accountable for duty whereas " quiet and comfortable place not accessible to the public" reflects a rest requirement specification.

Proposal: Replace with "Appropriate arrangements for crew awaiting any allocation of a duty period ."

comment 700

comment by: *Civil Aviation Authority of Norway*

This rule does not contain any provisions on how such standby-duty should affect the flight duty period (FDP), in contrast to EU-OPS 1.1125, pt. 1.3, where this is subject to regulation by national authorities. We feel that the relationship between airport standby and how this should affect the FDP, should be regulated. In Norway (and Sweeden and Denmark) we have regulated this as follows: "*Should airport standby as per OPS 1.1125 point 1.3 of Regulation (EEC) No. 3922/91 Annex III be immediately followed by a flight duty, the maximum daily flight duty period shall be charged with 100% of the standby period*".

comment 1123 comment by: ECA - European Cockpit Association

Comment on OR.OPS.050.FTL: change as follows:

Where operators assign crew members to standby duty, the following shall **be considered apply**, where applicable to the type of operation

Justification:

To provide the text with the intended meaning '*shall be considered*' must be replaced by '*shall apply*'.

comment 1124 comment by: ECA - European Cockpit Association

Comment on OR.OPS.050.FTL:

The start and end of airport SB needs to be defined as it is done under OR.OPS.350.FTL (b) (3) and should be moved to this section.

comment 1125 comment by: ECA - European Cockpit Association

Comment on OR.OPS.050.FTL (a):change as follows:

Aerodrome/operating site standby shall count in full for the purpose of cumulative duty hours. **No more than one consecutive duty should involve airport standby; such standby should be avoided when onerous duties are involved.**

Justification:

The Scientific evaluation suggests that no more than one consecutive duty should involve airport standby; such standby should be avoided when onerous duties are involved.

comment 1126 comment by: ECA - European Cockpit Association

Comment on OR.OPS.050.FTL (b): change as follows

Aerodrome/operating site standby duty which is immediately followed by a flight duty shall be added to the duty period and shall count for the purpose of calculating minimum rest periods; **it must be regarded as flight duty for the calculation of the applicable FDT limit unless approved mitigation measures are in place;**

Justification:

Scientific evaluation recommends that airport standby associated with an immediately following FDP counts as flight duty when calculating the maximum FDP. In general, aerodrome/operating site standby shall be treated like any other form of duty immediately prior to a FDP unless mitigation measurements such as an FRMS and/or facilities /sleeping facility suggest otherwise. The requirement to regard airport standby 100% under the FDP limit may eventually be reduced if a FRMS is in place and sleeping facilities away from

public areas are provided. A reduction below 50% shall not be considered.  
Scientific Evaluation:

In the meantime it would appear reasonable to propose that time spent in airport standby should normally count 100% as flight duty when calculating the maximum FDP.

comment 1127 comment by: *ECA - European Cockpit Association*

Comment on OR.OPS.050.FTL(c):

Aerodrome/operating site standby duty which does not lead to an assignment of flight duty shall be followed by a designated rest period followed by a designated rest period as stated in the applicable CS and allowing a minimum sleep opportunity of 8 hours.

comment 1413

comment by: Unionen/Sweden

- Airport standby shall count in its full extent when calculating the maximum FDP. Even when not called out airport standby shall be followed by the minimum rest period (12 hours). The maximum duration of airport standby shall be 12 hours.
- Time spent on standby other than airport standby shall be taken into account when calculating the maximum FDP depending on to what extent it overlaps the WOCL (if it covers the WOCL, it should not be counted as FDP). All time spent on standby shall be accounted for cumulative duty hours. The FDP shall be charged with 50% of the standby period of the crew member.

comment 1473

comment by: M Wilson-NetJets

**Original text:**

OR.OPS.050.FTL Standby duty

Where operators assign crew members to standby duty, the following shall be considered, where applicable to the type of operation:

- (a) Aerodrome/operating site standby shall count in full for the purpose of cumulative duty hours;
- (b) Aerodrome/operating site standby duty which is immediately followed by a flight duty shall be added to the duty period and shall count for the purpose of calculating minimum rest periods;
- (c) Aerodrome/operating site standby duty which does not lead to an assignment of flight duty shall be followed by a designated rest period;
- (d) Crew members on aerodrome/operating site standby duty shall be provided with a quiet and comfortable place not accessible to the public.

**Suggested new text:**

OR.OPS.050.FTL Standby duty

Where operators assign crew members to standby duty, the following shall be considered:

- (a) The operator shall take into account the facilities provided/available to the crew member during periods of standby when determining the reduction in maximum available duty time and flight duty time and in determining the influence they have in rest calculations.
- (b) The operator shall establish a maximum standby period for each type of

standby taking into account the facilities provided/available and the anticipation factor;  
 For determining the fatigue/rest balance of a facility the operator shall take the following factors into account:

- (a) Average and peak noise levels
- (b) Ability to control levels of light
- (c) Ability to control temperatures
- (d) Accessibility by other persons including other personnel and the public
- (e) Amenities such as chairs, sofa's, lounge chairs, beds, showers etc.

**Comment/suggestion:**

Standby can take different forms in different types of operations. The provisions in this IR are tailored to scheduled airline operations with a fixed base concept or with a limited number of destinations where certain facilities are more easily arranged. For a non-scheduled/de-centralized/on-demand operation there are many different options to provide different levels of accommodation during the standby period and their influence on different types of duty (including flight duty) and rest. As an Example the crewmember after a standby period of 4 hours maybe positioned to a new rest location in business class. With the current description of this paragraph this is not possible, but completely safe. To ensure the maximum flexibility for each type of operation the provisions of this paragraph need to be placed in the CS or AMC and the IR text changed.

comment 2278 comment by: *kapers Cabin Crew Union*

(c) ~~Aerodrome/operating~~ site standby duty which does not lead to an assignment of flight duty shall be followed by a designated rest period;

Replace: All

Reason: See the definition of 'Rest': Any duty period should be followed by rest.

(d) Crew members on aerodrome/operating site standby duty shall be provided with a quiet and **comfortable** place not accessible to the public.

Request: AMC or GM should recommend what is to be considered comfortable. General limitations for standby other than airport standby should be mentioned in OR.OPS.050FTL.

Add: (e) 50% of all time spent on standby duty shall count when calculating the maximum FDP.

Reason: See answer to question 15 of the MOEBUS study. It is not reasonable to expect crew to maintain high levels of vigilance on a long flight after 6/7 or even more hours of standby.

comment 2776 comment by: *Civil Aviation Authority of Norway*

Comment to subsection (a): No definition is made for "operating site".  
A definition should be taken into Ops 010.

comment 2777 comment by: *Civil Aviation Authority of Norway*

Comment to subsection c: The length of the rest period should be defined.

comment 2794 comment by: *BALPA*

Section (a) - Agree that any time spent on standby should be counted towards the duty hour totals.

However, there is no mention here of how reporting for an aerodrome/operating site standby will affect an individuals FDP. We feel it is imperative that the following text is introduced in order to avoid fatigue becoming an issue - "When a crewmember is on a standby duty on immediate readiness at an aerodrome/operating site, the allowable FDP is calculated using the start time of the standby duty."

Section (c) is far too vague.

Please define a "designated" rest period.

We feel the following sentence needs to be adopted in order to avoid operators planning less than 12 hours rest after such a duty:

"When any period of standby finishes, during which a call-out has not occurred, at least 12 hours rest must follow prior to the next duty period."

Section (d) - We feel that crew members must not be expected to conduct non-FDP related duties during this standby period.

comment 2817 comment by: *Irish Aviation Authority*

Paragraph (b) & (c)

Comment:

(b) There is no account for the time spent on standby at the aerodrome/operating site to be included in the FDP if a crew member is required to report for a flight duty when called out on standby. The normal practice is that the time spent on standby at the aerodrome/operating site prior to being called out for a flight duty is counted as FDP ( as the crew member has already reported for duty and is available immediately for a flight

duty).

(c) There is no guidance on the calculation of a designated rest period following a standby duty. The normal practice is that the time spent on standby at an aerodrome/operating site, if not called out for a flight duty, will count in full towards total duty time for the purpose of calculating a subsequent rest period.

comment 3621 comment by: ECA - European Cockpit Association

Comment:

The current proposed standby rules should be further detailed in line with the following proposed new text:

**- In general the total length of a standby period should be limited to provided protected rest periods. An operator shall understand the physiological need for rest as it is impossible to be ready for a maximum FDP at all times.**

**- For a prolonged standby period the operator and crew member shall agree on periods of rest during the standby. General rules should be outlined in the OM-A.**

**- At best the crew member should be able to take a rest which covers the WO CL. Any interruption of the rest by the operator must be considered adequately when allocating flight duty.**

**Non-airport standby shall count by 35% of its duration towards accumulative duty limits.**

Justification regarding the 35% figure:

CD 2000/79/EC limits the annual working time to 2000 hours considering 48 work weeks. This totals to 41,66 hrs per calendar week. The directive requires further a minimum of 96 days free of duty per 48 work weeks; thus two days per week. Should a crew member be on standby for a total of 5 days per week

this standby period shall be understood as an equal to 41,66 hrs of working time, to provide an evenly spread of working time during the rest of the yearly period.

5 days x 24 hrs = 120 hrs duration

120 hrs / 41,66 hrs per week ==> 35%

comment by: *IACA International Air Carrier Association*

(a) and (b)

Replace „any 12 consecutive calendar months“ by „one calendar year“ i.a.w. Subpart Q of EU-OPS Q.

The “900 hours in any 12 consecutive months” are not specified by ICAO and is more restrictive than the EU Working Time Directive EC 2000/79 Clause 8:

“Without prejudice to Clause 3, mobile staff in civil aviation shall be given days free of all duty and standby, which are notified in advance, as follows:

a) at least seven local days in each calendar month, which may include any rest periods required by law; and

b) at least 96 local days in each calendar year, which may include any rest periods required by law.

The Working Time Directive regulates the 4 weeks holidays on a yearly basis, not on any 12 consecutive months. Hence, it is possible to have two times 4 weeks in 12 consecutive months, where it would not be appropriate to fly 900 hours. Otherwise, one could have no holidays and should be allowed to fly more than 900 hours in these 12 consecutive months. Changing from calendar year to 12 consecutive months implies a complete change of all systems...

IACA carriers are highly subject to seasonal effects, e.g. peak during summer season. The “one calendar year” as in EU-OPS and Working Time Directive (Council Directive 2000/79/EC) reduces the problem to a one-time exercise at the end of the calendar year, i.e. in the winter low season. The EASA proposed

"12 consecutive months" presents however an unnecessary continuing exercise, also during the summer peak, without any safety benefit and which will lead to reduced flexibility in particular when planning crew members' leave. Note that this summer peak is not driven by the operator, but by the market itself, e.g. hard working families and tax payers going on well deserved summer holidays.

Finally, Certification Specification CS FTL.1.140 (a) and (b)(1) will avoid any intended abuse of the "one calendar year". The intent is already covered by 1.140 (c).

Again the legislation seems to be unaware of the reality in cooperate aviation. Mostly we do not fly very much and are well rested. The idea of a roster is not plausible for a minimum crew department nor required in the way you want it. I strongly recommend to make provisions in regulation that reflect reality. If I havent flown for, say 5 days, I could most likely do more than if I´m constantly interupting my sleep. Yet the regulations don´t come up these things.

A FRMS is a total overkill. What is so hard in understanding the word PRIVATE OPERATION as opposed to COMMERCIAL AIR TRANSPORT?

I really don´t understand what you are up to. The last legislation put in force was way more demanding from aircrews as the old german one, now we go back or just produce paper to cover?

comment 3396

comment by: Eurowings Luftverkehrs AG

FRMS is clearly a part of the Safety Management System. As stated by the EASA during the meeting in Cologne on 11.03.09 this chapter is not be understood as a need for implementing further rules in the CMS. Therefore this whole chapter has definitely to be taken out from the section of "Flight Duty and limitations and rest time requirements" and be moved. The existing limitations and rest time requirements are sufficient to ensure duty rosters that avoid fatigue. FRMS as part of a Management System is wrongly placed here!

comment 383 comment by: *Condor Flugdienst GmbH - FRA HO/R*  
 We, Condor Flugdienst GmbH, cannot properly comment to proposed ICAO FRMS document, as this will only be adopted late this year.

**OR.OPS.325.FTL – Fatigue Risk Management System**  
**Comment**  
 This requirement takes no account of airlines which have made significant investment in scientific and technical evaluation of FTL Schemes and changes to these schemes.  
**Proposal**  
*Where applicable in accordance with the Requirements of OR.OPS.025.FTL the FRMS of a commercial operator.....*

comment 451 comment by: *Quality Assurance, Denim Air*  
 The FRMS document from ICAO that the NPA relies on has not been finalized. It is not reasonable to ask the sector for comments to a draft guideline that we do not have nor can comment upon. Either define the requirements EASA wants or suspend, preferred option, the FRMS system until ICAO is ready.

comment 729 comment by: *Luftfahrt-Bundesamt*  
 The LBA does not agree to move EU-OPS in a CS, due to its legal uncertainty, even when the Basic Regulation asks for a CS.  
 We herewith request to establish a clear legal situation by keeping the FTL – Requirements in the Implementing Rules.  
 The FTL rules as proposed do not include requirements for corporate operations with non-complex motor powered aircraft. This is not acceptable as pilots of these aircraft deserve the same protection against fatigue as their colleagues in larger aircraft.  
 Justification: see LBA - General Comment, reasons 1 and 2

comment 1106 comment by: *AEA*  
**Relevant Text:**  
 The FRMS of a commercial operator shall contain the following components, where applicable to the type, size and complexity of the operations and of the corresponding flight time specification scheme (a) Fatigue Risk Management Policy (b) Education and Awareness Training Programmes (c) Process for the detection, reporting, investigation and management of fatigue risk (d) process for monitoring crew member fatigue (e) processes for reporting, investigating and recording incidents that may be attributable wholly or partially to fatigue (f) FRMS feedback and adjustment mechanism  
**Comment:**  
 This is prescriptive overregulation which would lead to unjustified organizational costs for airlines whereas it does not take into account the fact that fatigue is one input to an airline's safety management systems along other potential safety hazards. There should not be a separate management system for fatigue. FRMS should remain optional for those airlines that want to gain

additional flexibility to operate for specific flights beyond the limits of prescriptive FTL schemes such as Subpart Q of EU-OPS.

Comment on OR.OPS.325.FTL:

The FRMS of a commercial operator shall contain the following components, ~~where applicable to the type, size and complexity of the operations and of the corresponding flight time specification scheme:~~

Justification:

FRMS (Fatigue Risk Management Systems)

"... **where applicable** ..." shall be deleted since the text is for commercial operators only and all of them should follow this FRMS structure.

Further operators should be provided with rules and guidance on the essential elements a FRMS must contain; the recent ICAO working paper (ICAO, 2008) provides such guidance

comment 1198 comment by: Sven Freisenich

Same comments as under OR.OPS.025.FTL

Should be deleted as this appears to be prescriptive overregulation which would lead to unjustified organisational costs for airlines. Fatigue is only one input to an airline's safety management systems along other potential safety hazards. There should not be a separate management system for fatigue. FRMS should be part of SMS.

comment 1285 comment by: Dassault Aviation

Technical comment:

Page 28 OR.OPS.325.FTL Fatigue Risk Management System (FRMS). FRMS, as the flight safety department and the quality system, should be an independent body within the operator's organization. In addition to the recommended members, the Fatigue Management Steering Group (FMGS) should ideally incorporate one or more FRMS auditors, in charge of the internal audits.

comment 1567 comment by: British Airways

Please remove the section relating to FRMS until ICAO provide clearer definition of requirements.

Point 43 of NPA 2009 - 2A states ". The FRMS is a scientifically based, datadriven ongoing adaptive process that can identify fatigue risks and develop and evaluate mitigation strategies to manage any emerging operational risks. A FRMS is an integral part of an operator's established management system and should be based on a partnership approach between the operator, competent authority and crew member representatives. The FRMS gives the possibility to apply more flexibility in comparison with prescriptive FTL requirements. FRMS is based on "just culture" and therefore the related GM clarifies the role and responsibilities of operators and crew members. In addition, it explains essential minimal FRMS components to be included as integral part of an operator's established management system and provides with the guidance to assure that fatigue risk management is implemented effectively and that regulatory oversight is performed in a reliable and verifiable documented manner."

**CFDT France Comment:**

*Individual & varied flight schemes can be approved by the authority as long as it*

*Does not create "fatigue risks" which are listed /enumerated in the FRMS ...*

*As most of the flight duty limitations and rest periods are CS material the CFDT feels that this leaves a lot of room for varying flight schemes which may compromise the safety of flights by introducing fatigue generating schemes. THE CFDT ASKS FOR FTL PROVISIONS TO BE IR and NOT CS MATERIAL*

*The CFDT asks how FATIGUE can be realistically measured by the FRMS.*

comment by: DGAC

DGAC contributed to the development of FRMS through its participation in the ICAO Fatigue Risk Management Sub-Group (FRMSG) of the OPS panel. It was the group consensus that FRMS should be implemented by educated operators only. Because of the complexity of the scientific knowledge and analysis methodologies required (as noted in the proposed OR.OPS), FRMS should be implemented for specific issues (e.g. ultra long range flights).

Therefore we strongly recommend limiting FRMS to operators that need a flexible roster for a limited number of cases, i.e. ultra long range, reduced rests, and/or slip duty. The existing FRMS that have been scientifically validated are focused on specific issues (ULR, specific schedule, reduced rests or split duty). There is no scientific feedback from States or operators (i.e. New Zealand) implementing an FRMS for all operations. Nevertheless it is known that some operators rely on recognised high level scientific resources to monitor their FRMS.

Fatigue as a risk may or may not be identified under the Management System (part OR.GEN.200). When an operator has identified fatigue as a risk then the obvious countermeasure is to implement an FRMS. Operators that implement CS.FTL should not be required to implement FRMS.

Requiring FRMS for all operators will unduly increase costs to operators that implement CS.FTL and might give rise to a non effective and non harmonised FRMS for operators that do not have the resources to establish and maintain a good quality FRMS. The burden to the authority will also unduly increase.

Therefore it is proposed to amend the paragraph requiring a FRMS accordingly

comment 3383 comment by: *FNAM (Fédération Nationale de l'Aviation Marchande)*

**Comment**

EASA went further than real meaning of ICAO FRMS proposal as it extended the original range of the FRMS wished by ICAO. Partially because of this, ICAO chose to discard its FRMS proposal and postpone this project by re-opening the working group. As a result EASA FRMS do not rely anymore on any legal basis.

**Proposal**

In the case that FRMS had to be implemented by operators, it should only done according to special/specific operations and not generalized to all operations. It should only be mandatory for operations deviating from the individual flight time limitation scheme.

**Justification**

Obvious

 (d) (5)  
 Comment: There appears to be no OR.OPS.055.FTL relating to Rest Periods.  
 Proposal: The operator shall establish rest requirements specifying the minimum rest period at home base and the minimum rest period away from home base together with recurrent extended recovery rest periods.

comment 702 comment by: *Civil Aviation Authority of Norway*  
 General comment:  
 The Norwegian Operators Widerøe and Lufttransport has been granted a

derogation in accordance with Regulation 3922/91, article 8(3) to operate with a different flight-time limitation scheme than the requirement in EU-OPS, OPS 1.1100, 1.1 (b). These derogations have been approved by EFTA after consultations with EASA. The procedure for such approval have been similar to the approval process of a flight time specification scheme (CS FTL) suggested in OR.OPS.330.FTL. The question is whether these derogations can be expected to be "grandfathered" as CS FTL under the new Part OR, Subpart OPS, or if the affected operators have to re-apply for the derogation to be accepted as a CS FTL.

In our opinion, the derogations with regard to EU-OPS, Subpart Q granted under article 8(3) in Regulation, should be allowed to be "grandfathered" into the new system.

comment 730

comment by: *Luftfahrt-Bundesamt*

The LBA does not agree to move EU-OPS in a CS, due to its legal uncertainty, even when the Basic Regulation asks for a CS.

We herewith request to establish a clear legal situation by keeping the FTL – Requirements in the Implementing Rules.

The FTL rules as proposed do not include requirements for corporate operations with non-complex motor powered aircraft. This is not acceptable as pilots of these aircraft deserve the same protection against fatigue as their colleagues in larger aircraft.

Justification: see LBA - General Comment, reasons 1 and 2

If it is not deleted, than at least the word 'operational experience' should be added to (c) (5)

comment

1132

comment by: ECA - European Cockpit Association

Comment on OR.OPS.330.FTL (c) :

(3) include a detailed description of the fatigue risk management system, **including of all essential components of and basic requirements for an FRMS, as described in GM O R.OPS.325, as well as evidence of its effective implementation;**

## Justification:

Before a national authority - and EASA - approves an individual scheme, there must be proven that

1. the FRMS is actually implemented (and does not only exist on paper)
2. that the FRMS contains the essential components of and meets the basic requirements for an FRMS. It is crucial to have this reference in the Implementing Rules, as the current EASA proposal delegates all the details of FRMS to GM status. The GM status opens the door for operators to cherry-pick what they want, especially as the guidelines stress that an FRMS is to be tailored to the type, size and complexity of the operation (which could be abused by operators to pick and chose).

comment

1133

comment by: ECA - European Cockpit Association

Comment on OR.OPS.330.FTL (c): change as follows:

(4) include a risk assessment, **including a hazard an alysis a nd risk management log;**

## Justification:

To be consistent with ICAO SMS procedures and requirements, and to ensure the (safety) risk assessment is sound and usable for the purpose of a variation/individual FTL scheme, it is recommended to specify that such a risk assessment includes a hazard analysis and risk management log.

To provide a record of identified safety risks and the actions taken by nominated individuals at the operator. The record should be retained permanently in the "safety library" in order to provide evidence of safety risk management and to provide a reference for future risk assessments.

Having identified and ranked the safety risks, any existing defences against them can be identified and assessed for adequacy. All actions must be addressed by a specified individual.

comment

1134

comment by: ECA - European Cockpit Association

Comment on OR.OPS.330.FTL (c): change as follows:

(5) be supported by an assessment based on ~~current~~**latest** scientific principles, **evidence** and knowledge, **and which shall be open to the public for review by stakeholders**; and

Justification:

The wording should be as close to BR Art. 22(2)a), i.e. "latest" and "evidence" should be added. Experience with derogations has shown so far, that operators using scientific assessments may have an unhealthy influence on the assessments results, being the one who pays for such an assessment. In the UK, any scientific studies undertaken are open to stakeholder and peer review. Only if the scientific studies/assessments are made public and can be commented upon, we can make sure that "science for sale" does not support dodgy applications / schemes. A similar provision should be made in the related ARs.

comment 1135

comment by: ECA - European Cockpit Association

Comment on OR.OPS.330.FTL (c): change as follows:

(6) include details **and documentation** regarding **meaningful** consultation with the affected **groups stakeholders, in particular crew member representatives whose observations on the the individual scheme shall be documented in detail, including contact details of the relevant representatives.**

Justification:

This proposed provision does not state that stakeholders / interested parties have to be consulted on such individual schemes. However, these stakeholders, and in particular crew representatives who know the operations from inside, will often be the ones best placed to detect negative safety implications of elements of the proposed scheme. Such observations must be made available to the authority - and subsequently to EASA - to ensure the approval takes all aspects into account.

This is an important element guaranteeing that operators/NAA do not propose problematic schemes. It helps to ensure good quality of the application for an individual scheme, making it easier for the Authority and EASA to assess the scheme.

Apart from that, consultation of "interested parties" is required under Subpart Q 1.1090, 5.1.1. This is a legally binding requirement under Subpart Q. BR Art. 22(2)a) states that the FTL-related EASA implementing rules "shall include all substantive provisions of Subpart Q". Hence, this substantial requirement needs to be reflected in OR.OPS.330.FTL (c) (6).

comment 1137

comment by: ECA - European Cockpit Association

Comment on OR.OPS.330.FTL(d):

Add provisions as per Moebus study answers to questions 3, 15 and 16. Moreover, essential elements are missing to regulate augmented crew operations.

Justification:

Without more detailed rules on this issue many long range flights could not be operated. Further answers need to be found to the following questions raised through the scientific evaluation:

**Question 3**

*The use of rostered extensions including the mitigation measures (ref EU OPS 1.1105 para 2)*

*Strong recommendation to remove those provisions*

**Question 15**

*What provisions are needed for the calculation of maximum FDP and minimum post duty rest when called out from other forms of standby. (ref EU OPS 1.1125 para 2.1.4)*

**Question 16**

*What guidelines are needed for the counting of standby times for cumulative duty hours?*

*(ref EU OPS 1.1125 para 2.1.5)*

3164

comment by: *DGAC*

**(d)(5)** : There is a mention to an "OR.OPS.055.FTL" which does not exist. Besides there misses a paragraph carrying a provision equivalent to item 3.5 of EU-OPS 1.1090 :

*3.5. Operators shall ensure that rest periods provide sufficient time to enable crew to overcome the effects of the previous duties and to be well rested by the start of the following flight duty period.*

This was may be the intention of the drafter to have such provision in OR.OPS.055 FTL.

comment

3165

comment by: DGAC

**New (e) and (f) :**

**Proposal:** Amend the paragraph by adding two new items, (e) and (f) as follows :

"(e) To implement an individual flight time specification scheme described in (c), commercial operators shall establish, implement and maintain an FRMS as an integral part of its management system.

(f) The individual flight time specification scheme described in (c) shall deviate from CS.FTL only in respect to ultra long range flights, reduced rests and split duty specifications."

**Justification:** see comments on OR.OPS.025 and OR.OPS.325:

*"DGAC contributed to the development of FRMS through its participation in the ICAO Fatigue Risk Management Sub-Group (FRMSG) of the OPS panel. It was the group consensus that FRMS should be implemented by educated operators only. Because of the complexity of the scientific knowledge and analysis methodologies required (as noted in the proposed OR.OPS), FRMS should be implemented for specific issues (e.g. ultra long range flights).*

*Therefore we strongly recommend limiting FRMS to operators that need a flexible roster for a limited number of cases, i.e. ultra long range, reduced rests, and/or slip duty. The existing FRMS that have been scientifically validated are focused on specific issues (ULR, specific schedule, reduced rests or split duty). There is no scientific feedback from States or operators (i.e. New Zealand) implementing an FRMS for all operations. Nevertheless it is known that some operators rely on recognised high level scientific resources to monitor their FRMS.*

*Fatigue as a risk may or may not be identified under the Management System (part OR.GEN.200). When an operator has identified fatigue as a risk then the obvious countermeasure is to implement an FRMS. Operators that implement CS.FTL should not be required to implement FRMS.*

*Requiring FRMS for all operators will unduly increase costs to operators that implement CS.FTL and might give rise to a non effective and non harmonised FRMS for operators that do not have the resources to establish and maintain a good quality FRMS. The burden to the authority will also unduly increase."*

*Therefore it is proposed to amend the paragraph requiring a FRMS accordingly.*

- Currently, there are legal regulations for HEMS operations which reflect the character of these operations and the actual realities and frequency of HEMS crew's flights and duty patterns. The minimum rest period for HEMS operations is set to 9 hours between flight duties, of which there is a minimum period of 8 hours sleep in a separate room provided. The pilot also has the possibility to rest in the provided sleeping area during the flight duty period. The maximum duty period is set to 15 hours (including at least 15 minutes for pre-flight preparation and at least 30 minutes for post-flight activity). This HEMS flight duty system is fully accepted by the Czech CAA.

**OR.OPS.335.FTL (c) – Flight Duty Period****Comment**

To support the contention in the definitions of WOCL in this submission add '*operator approved*' to the WOCL reference

**Proposal**

Reductions in the maximum daily FDP when this maximum would start, end or encompass the *operator approved* window of circadian low.

**OR.OPS.335.FTL (d)(5) – Flight Duty Period (FDP)****Comment**

In the definition of the flight time specification scheme there is a requirement to specify 'off-duty' periods on the ground during a single FDP. This would appear to be a typographical error

**Proposal**

(5) Periods *of* duty on ground during a single FDP

**OR.OPS.335.FTL (d)(6) – Flight Duty Period****Comment**

The inclusion of the undefined phrase of 'in-flight break' implies a requirement for at least two separate 'breaks' within a single FDP. 'In-flight breaks' are adequately addressed under OR.OPS.015.FTL (i) – meal and drink opportunity.

**Proposal**

DELETE

**Proposed new requirement OR.OPS.335.FTL (f) Flight Duty Periods****Comment**

Currently the draft requirements make no provision for a split duty, primarily used by operators to recover an aircraft to base.

**Proposal**

Flight time specification schemes for commercial operators shall specify the following FDP elements where applicable to the type of operation:

- (f) Rest requirements and maximum extension of an FDP when operating a split duty

comment 495

comment by: CityJet

**'OR.OPS.340.FTL Extended Duty (Split Duty)**

**Flight time specification schemes for commercial operators shall specify the following Extended Duty (Split Duty) elements, where applicable to the type of operation:**

- (a) The maximum and minimum periods of consecutive rest which may be allowed for a duty to qualify as an Extended Duty, and the criteria to calculate the maximum extension allowed;**  
**(b) The maximum flight duty period (FDP) allowed before and after the break;**  
**(c) The maximum number of sectors that may be operated before and after the break;**  
**(d) The method of calculating the total duty time generated by the Extended FDP to ensure an adequate rest period following the duty, and also for the calculation of cumulative rest;**  
**(e) The requirement for the provision of adequate rest facilities and/or suitable accommodation during the break;**  
**(f) The definition of the time allowed for immediate post-flight and pre-flight duties in the course of the Extended Duty'.**

comment 675

comment by: easyjet safety

(c)

Comment: Textual clarification

Proposal: "when this maximum would start within, end within or encompass...."

(d) (5)

Comment: Presumably this provision allows for the concept of split duty but nevertheless requires further clarification

Proposal: Amend to read: "Time spent off duty on the ground during a single FDP where two or more sectors are separated by less than a minimum rest period."

comment 731

comment by: Luftfahrt-Bundesamt

The LBA does not agree to move EU-OPS in a CS, due to its legal uncertainty, even when the Basic Regulation asks for a CS.

We herewith request to establish a clear legal situation by keeping the FTL – Requirements in the Implementing Rules.

The FTL rules as proposed do not include requirements for corporate operations with non-complex motor powered aircraft. This is not acceptable as pilots of these aircraft deserve the same protection against fatigue as their

colleagues in larger aircraft.  
Justification: see LBA - General Comment, reasons 1 and 2

**Proposal:**

(5): periods off duty on ground during a single FDP (split-duty);

comment 1139

comment by: ECA - European Cockpit Association

Comment on OR.OPS.335.FTL(d):

Further legal provisions need to be developed based on the questions raised and answers given by the Moebus Study (see below):

**Question 11**

*What provisions are needed for extend FDP operations with augmented crew and/or time zone crossings? (ref EU OPS 1.1115 para 1.1)*

Answer:

Setting additional restrictions related to augmented crew in respect to the maximum FDP with augmented crew i.e. taking into account quality of the bunk facilities and the effect of crew acclimatization (e.g. FDP may be extended by a period equal to three-quarters of the total rest taken, if in-flight relief and adequate bunk facilities are provided; or equal to half of the total rest taken if the aircrew is not acclimatized).

**Question 12**

*quality of rest regarding rest location/ rest facilities for flight crew and cabin crew (ref EU OPS 1.1115 para 1.1 and 1.2)*

Answer:

Not allowing extensions of the FDP in case of rest in economy class seats.

**Question 6**

*Which detailed provisions and guidelines are needed within Subpart Q regarding split duty? (ref EU OPS 1.1105 para 6)*

Answer:

There are no scientific studies on the impact of split duty and further studies are required. Nevertheless it is recommended to set additional restrictions:

1. The break between two sub-duties should be at least one third of the length of the total flight duty period
2. Adequate sleeping facilities must be provided by the operator if the break does not take place where the crew lives
3. total flight duty period of a split duty should never start before 6:00 or end after 22:00
4. In the case of consecutive split duties, the total FDP of a split duty should never be extended beyond 14 hours in order to allow an absolute minimum of 10 hours daily rest
5. Consecutive split duties with reduced daily rest time must be accompanied by an FRMS that includes training of crews and reporting systems

Further comment:

So far there are no detailed provisions / rules on the operation with augmented crews. However, appropriate requirements and guidelines must be drafted and should regard the SARPs established in **ICAO Annex 6** and the scientific findings as for example found in: TNO-V 2007C363 "Extension of flying duty period by in-flight relief" or Simons M & Spencer M, 2007

So far there are no provisions / rules on the operation of ULR.

So far there are no provisions / rules on the scheduling of split duty.

As a consequence without any such rules in place the mentioned type of operation could not be operated beyond the day this regulation becomes effective.

comment

1140

comment by: ECA - European Cockpit Association

Comment on OR.OPS.335.FTL(e): add as follows:

(e) Conditions under which the FDP, flight times and duty periods may be exceeded or rest periods may be reduced by the pilot-in-command after consultation with all crew members, in the case of unforeseen circumstances in actual flight operations after the reporting time, and the procedures used to report these modifications; **any reduced rest of less than 12 hours shall include the entire WOCL.**

Justification:

Scientific evaluation recommends that any reduced rest of less than 12h should include the entire WOCL.

comment

1203

**OR.OPS.335.FTL Flight Duty Period (FDP)**

~~Flight time specification schemes for commercial operators shall specify the following FDP elements, where applicable to the type of operation:~~

~~(a) Maximum basic daily FDP;~~

~~(b) Reductions of the maximum basic daily FDP dependent on the number of sectors flown;~~

~~(c) Reductions of the maximum basic daily FDP when this maximum would start, end or encompass the Window of Circadian Low (WOCL);~~

~~(d) Conditions for extensions of the maximum basic daily FDP, taking into account:~~

~~(1) the number of sectors flown;~~

~~(2) FDPs within the WOCL;~~

~~(3) a maximum number of extensions for a consecutive number of days;~~

~~(4) increased pre and post flight minimum rest periods;~~

~~(5) periods off duty on ground during a single FDP;~~

- ~~(6) the minimum of in-flight break allocated to each crew member; and  
(7) the augmentation of the basic flight crew~~

**THE CF DT France asks for Replacement by :** Flight time specification schemes for commercial operators shall specify the following FDP elements, where applicable to the type of operation:

- (a) Maximum basic daily FDP of 13 hours;  
 (b) Reductions of the maximum basic daily FDP dependent on the number of sectors flown (*These 13 hours will be reduced by 30 minutes for each sector after the first.*);  
 (c) Reductions of the maximum basic daily FDP when this maximum would start, end or encompass the Window of Circadian Low (WOCL) *with a maximum FDP of 10 hours for FDPs that encompass the WOCL.*;  
 (d) Conditions for extensions of the maximum basic daily FDP, taking into account:  
 (1) the number of sectors flown;  
 (2) FDPs within the WOCL;  
 (3) a maximum number of extensions for a consecutive number of days;  
 (4) increased pre and post flight minimum rest periods;  
 (5) periods off duty on ground during a single FDP;  
 (6) the minimum of in-flight break allocated to each crew member  
 (7) the augmentation of the basic flight crew; *and*  
 (8) *the augmentation of the basic cabin crew*

**Reason:** The BR Art. 22 2. (a) states that IR shall include all substantive provisions of Subpart Q, taking into account latest scientific and technical evidence. The 13 hours maximum daily FDP must be considered a substantive provision and should therefore be reflected in the IR.

Taking into account latest scientific evidence, the MOEBUS study recommends reducing the maximum basic FDP after the first sector and furthermore establishes the need for more scientific evaluation of any FDP that includes more than 4 sectors. Regarding FDP that include the WOCL, these should, according to the results of the MOEBUS study, never exceed 10 hours.

Regarding (6) the conditions for in-flight breaks should be established in CS, taking into account the recommendations of latest scientific evidence (MOEBUS study) and operational best practices.

- (a) Maximum basic daily FDP *of 13 hours;*
- (b) Reductions of the maximum basic daily FDP dependent on the number of sectors flown *(These 13 hours will be reduced by 30 minutes for each sector after the first.);*
- (c) Reductions of the maximum basic daily FDP when this maximum would start, end or encompass the Window of Circadian Low (WOCL) *with a maximum FDP of 10 hours for FDPs that encompass the WOCL.;*
- (d) Conditions for extensions of the maximum basic daily FDP, taking into account:
  - (1) the number of sectors flown;
  - (2) FDPs within the WOCL;
  - (3) a maximum number of extensions for a consecutive number of days;
  - (4) increased pre and post flight minimum rest periods;
  - (5) periods off duty on ground during a single FDP;
  - (6) the minimum of in-flight break allocated to each crew member
  - (7) the augmentation of the basic flight crew; *and*
  - (8) *the augmentation of the basic cabin crew*

Reason: The BR Art. 22 2. (a) states that IR shall include all substantive provisions of Subpart Q, taking into account latest scientific and technical evidence. The 13 hours maximum daily FDP must be considered a substantive provision and should therefore be reflected in the IR.

Taking into account latest scientific evidence, the MOEBUS study recommends reducing the maximum basic FDP after the first sector and furthermore establishes the need for more scientific evaluation of any FDP that includes

more than 4 sectors. Regarding FDP that include the WOCL, these should, according to the results of the MOEBUS study, never exceed 10 hours. Regarding (6) the conditions for in-flight breaks should be established in CS, taking into account the recommendations of latest scientific evidence (MOEBUS study) and operational best practices.

OR.OPS.335.FTL Flight Duty Period (FDP)

Flight time specification schemes for commercial operators shall specify the following FDP elements, where applicable to the type of operation:

- (a) Maximum basic daily FDP;
- (b) Reductions of the maximum basic daily FDP dependent on the number of sectors flown;
- (c) Reductions of the maximum basic daily FDP when this maximum would start, end or encompass the Window of Circadian Low (WOCL);
- (d) Conditions for extensions of the maximum basic daily FDP, taking into account:

**Comment:**

Text seems to have been written for short/medium haul operation as the word 'daily' has no relevance for long haul operations in terms of prescribing FDP. Including the word daily is confusing and could potentially lead to errors in interpretation as FDP can cross over different days.

**Proposed Text:**

Remove the word 'daily' and replace text as follows:

Flight time specification schemes for commercial operators shall specify the following FDP elements, where applicable to the type of operation:

- (a) Maximum basic FDP;
- (b) Reductions of the maximum basic FDP dependent on the number of sectors flown;
- (c) Reductions of the maximum basic FDP when this maximum would start, end or encompass the Window of Circadian Low (WOCL);

comment by: Southern Cross International

Due to the type of operations of our company (test and ferry flights), their infrequent nature and taking into consideration the wide variety of aircraft operated by our company, the different equipment fits for each of those aircraft, the extreme short period of time those aircraft are operated, and the fact that the majority of our crews are employed on a contract per flight basis, it is most likely that the majority of the listed components will not be applicable to our company.

- ~~(b) Reductions of the maximum basic daily FDP dependent on the number of sectors flown;~~
- ~~(c) Reductions of the maximum basic daily FDP when this maximum would start, end or encompass the Window of Circadian Low (WOCL);~~
- ~~(d) Conditions for extensions of the maximum basic daily FDP, taking into account:~~
  - ~~(1) the number of sectors flown;~~
  - ~~(2) FDPs within the WOCL;~~
  - ~~(3) a maximum number of extensions for a consecutive number of days;~~
  - ~~(4) increased pre and post flight minimum rest periods;~~
  - ~~(5) periods off duty on ground during a single FDP;~~
  - ~~(6) the minimum of in-flight break allocated to each crew member; and~~
  - ~~(7) the augmentation of the basic flight crew~~

Replace: Flight time specification schemes for commercial operators shall specify the following FDP elements, where applicable to the type of operation:

- (a) Maximum basic daily FDP of 13 hours;
- (b) Reductions of the maximum basic daily FDP dependent on the number of sectors flown (*These 13 hours will be reduced by 30 minutes for each sector after the first.*);
- (c) Reductions of the maximum basic daily FDP when this maximum would start, end or encompass the Window of Circadian Low (WOCL) *with a maximum FDP of 10 hours for FDPs that encompass the WOCL.*;
- (d) Conditions for extensions of the maximum basic daily FDP, taking into account:
  - (1) the number of sectors flown;
  - (2) FDPs within the WOCL;
  - (3) a maximum number of extensions for a consecutive number of days;
  - (4) increased pre and post flight minimum rest periods;
  - (5) periods off duty on ground during a single FDP;

- (6) the minimum of in-flight break allocated to each crew member  
 (7) the augmentation of the basic flight crew; *and*  
 (8) the augmentation of the basic cabin crew

Reason: Taking into account latest scientific evidence, the MOEBUS study recommends reducing the maximum basic FDP after the first sector and furthermore establishes the need for more scientific evaluation of any FDP that includes more than 4 sectors. Regarding FDP that include the WOCL, these should, according to the results of the MOEBUS study, never exceed 10 hours. Regarding (6) the conditions for in-flight breaks should be established in CS, taking into account the recommendations of latest scientific evidence (MOEBUS study) and operational best practices.

The BR Art. 22 2. (a) states that IR shall include all substantive provisions of Subpart Q, taking into account latest scientific and technical evidence. The 13 hours maximum daily FDP must be considered a substantive provision and should therefore be reflected in the IR.

comment by: ANE (Air Nostrum) OPS QM

Reference OPS 1.1105, in point 6.1 of EU-OPS article , it is specified that operations based on an extended FDP including a break , may be granted by authority (upon article 8 provisions). This option is not included in OR article.

We request the addition of a reference to possible alleviations in the wording of the OR.OPS.355 FTL just like there is in EU OPS 1.1105

Recent EASA presentations regarding options for future FTL scheme for CAT operations [RM task OPS 055] means this section remains under review. A lack of response at this time should not be interpreted as tacit acceptance of Section VIII. We reserves the right to come back to EASA on Section VIII once the options issue has been settled.

We understand that the Agency are planning separate Rule making activity in regard to FTL and wish to re-iterate that we would welcome Industry participation.

**OR.OPS.335.FTL Flight Duty Period (FDP)**

(6) the minimum of in-flight break allocated to each crew member.....

This requirement leaves out what can be considered as an "in-flight break". Is the affected crew member to be free of all duties (will not work on any aeroplane when operated by min crew req'd as the operation then would actually be BELOW min number of cabin crew req'd as one is "on break". Who logs / proofs, that the required break(s) have taken place? - the commander is finally responsible that these regulations are met.

We do not consider this regulation useful to enhance safety as the existing framework anyhow requires (cabin) crewmembers to be able to "stand their duty" accordingly.

**OR.OPS.350.FTL (a)(2)****Comment**

The requirement to take account of facilities available for the crew member to rest while on standby at home or at a place other than the aerodrome/operating site falls outside the control of the operator.

**Proposal**

(2) The relationship between standby duty and any assigned flight duty resulting from a standby duty at home or at aerodrome/operating site

**OR.OPS.350.FTL (a)(3)****Comment**

This would mean that all persons subject to the FTL would require minimum rest following standby and prior to non-safety related administrative duties

**Proposal**

(3) The determination of the rest period following standby duty which does not lead to the assignment of a flight duty, *and prior to a subsequent flight duty period, standby duty or simulator duty*

**OR.OPS.350.FTL (b)(1) & (2)****Comment**

The use of the words 'in advance' could be interpreted as preventing operators from assigning crew members to a standby duty following operational disruption/flight cancellation

**Proposal**

(b)(1) *Normally* standby duty shall rostered and *where possible* the affected crew member shall be notified in advance

(b)(2) *Normally* the start and end times of a standby duty shall be defined and the affected crew member shall, *where possible*, be notified in advance

comment by: Luftfahrt-Bundesamt

The LBA does not agree to move EU-OPS in a CS, due to its legal uncertainty, even when the Basic Regulation asks for a CS.

We herewith request to establish a clear legal situation by keeping the FTL – Requirements in the Implementing Rules.  
 The FTL rules as proposed do not include requirements for corporate operations with non-complex motor powered aircraft. This is not acceptable as pilots of these aircraft deserve the same protection against fatigue as their colleagues in larger aircraft.  
 Justification: see LBA - General Comment, reasons 1 and 2

comment 1142 comment by: ECA - European Cockpit Association

Comment on OR.OPS.350.FTL:

Merge paragraph with OR.OPS.050.FTL

Justification:

Both regular SB (OR.OPS.350.FTL) and airport SB (OR.OPS.050.FTL) should be gathered in the same section taking into account Moebus study.

Other wise this section should be called:

"Standby duty - *general*"

comment 1146 comment by: ECA - European Cockpit Association

Comment on OR.OPS.350.FTL(a): add new requirement for standby as proposed below:

Aerodrome / operating site standby (i.e. Airport standby) just like any other duties immediately prior to a flight duty not separated by an intervening rest period must be counted under the limitation of the maximum FDP in reference to the beginning of the duty as reporting time as the latest scientific studies recommend and as Moebus and CAP 371 count airport stay as FDP.

Standby duty other than aerodrome / operating site standby shall be conducted under detailed rules which should encompass the following proposal:

- In general the total length of a standby period should be limited to provided protected rest opportunities. An operator shall understand the physiological need for rest as it is impossible to be ready for a maximum FDP at all times.

- For a prolonged standby period the operator and crew member shall agree on periods of rest during the standby. General rules should be outlined in the OM-A.

- At best the crew member should be able to take a rest which covers the WOCL. Any interruption of the rest by the operator must be considered adequately when allocating flight duty.

Non- airport standby shall count by 35% of its duration towards accumulative duty limits.

Any SB duty shall be followed by a rest period as stated in CS FTL.1.155 (a) and (b).

Explanation:

CD 2000/79/EC limits the annual working time to 2000 hours considering 48 work weeks. This totals to 41,66 hrs per calendar week. The directive requires further a minimum of 96 days free of duty per 48 work weeks; thus two days per week. Should a crew member be on standby for a total of 5 days per week

this standby period shall be understood as an equal to 41,66 hrs of working time, to provide an evenly spread of working time during the rest of the yearly period.

5 days x 24 hrs = 120 hrs duration  
 120 hrs / 41,66 hrs per week ==> 35%  
 CAP 371 and Moebus --> airport standby is FDP

comment 1147 comment by: ECA - European Cockpit Association

Comment on OR.OPS.350.FTL(b): The text "...shall be considered" must be changed to "...shall apply" should it have any significance at all.

(b) Where commercial operators assign crew members to standby duty, the following shall ~~be considered~~ **apply**, taking into account the type of operation:

Justification:

**Question 15** / Moebus study

What provisions are needed for the calculation of maximum FDP and minimum post duty rest when called out from other forms of standby. (ref EU OPS 1.1125 para 2.1.4)

The scientific evaluation suggests that the longer the crew has been standby at home, the greater should be the contribution towards maximum FDP and minimum post duty rest period.

comment 1210 comment by: Sven Freisenich

See also comments under OR.OPS.010.FTL (c) Duty and need for additional definition of "Standby duty" to make clear not all "standby" is "duty".

comment 1390 comment by: SCCA/ head of health and safety

**1)** Airport standby shall count in its full extent when calculating the maximum FDP. Even when not called out airport standby shall be followed by the minimum rest period (12 hours). The maximum duration of airport standby shall be 12 hours.

**2)** Time spent on standby other then airport standby shall be taken into account when calculating the maximum FDP depending on to what extent it overlaps the WOCL (if it covers the WOCL, it should not be counted as FDP). All time spent on standby shall be accounted for cumulative duty hours. The FDP shall be charged with 50% of the standby period of the crew member.

comment by: Jill Pelan

**OR.OPS.350.FTL Standby duty****THE CFDT France ASKS FOR THE FOLLOWING AMENDMENTS**

(a) Flight time specification schemes for commercial operators shall specify the following elements for standby duty, where applicable to the type of operation:

- (1) A determination of the maximum length of any standby duty;
- (2) The relationship between standby duty and any assigned flight duty resulting from the standby duty, taking into account facilities available for the crewmember to rest and other relevant factors;
- (3) ~~A determination of the rest period following standby duty which does not lead to assignment on a flight duty;~~
- (4) ~~How standby times are counted for the purposes of cumulative duty hours.~~

(b) Where commercial operators assign crew members to standby duty, the following shall be considered, taking into account the type of operation:

- (1) Standby duty shall be rostered and the affected crew members shall be notified in advance;
- (2) The start and end time of the standby duty shall be defined and the affected crew members shall be notified in advance;
- (3) Aerodrome/operating site standby duty shall start from the crew member reporting at the designated normal report point and shall end as notified.

**CFDT Request:** regarding (a)(1), CS, issued by EASA, should establish the maximum length of any standby duty.

Reason: BR 216/2008, art. 22 2.(a): Latest scientific and technical evidence have to be taken into account; the results of the MOEBUS study have not been able to offer a conclusive result proposing a concrete maximum amount of hours, further medical studies should be commissioned. In the meantime CS should reflect national best practices: Example: The UK CAP 371 proposes a limit of 12 hours for all cases of standby (see 12.4 CAP 371, Section B, page 8).

**Request C FDT:** regarding (a)(2), 1.- CS, issued by EASA, should establish that airport standby cannot count as rest and should therefore be considered as FDP in its full extent.

2.- For standby other than airport standby, CS, issued by EASA should propose a formula to calculate the relationship between standby duty and the following FDP. This formula should be based on best national practices (i.e. UK CAP 371 12.4) and latest scientific and technical evidence; the answer to question 15 of the MOEBUS study requests more scientific evaluation of this problem, we therefore call upon EASA to commission further scientific evaluation of this item.

**Reason:** 1.- The MOEBUS study suggests in the answer to question 14: ... *we know of no scientific evidence to suggest that airport standby should be considered as any less fatiguing than flight duty...*, leading to the conclusion that it should be considered as FDP.

2.- Existing national regulations, i.e. UK CAP 371, propose a formula to establish a relationship between standby duty and any assigned flight duty. These can be considered best practices and should therefore as stated in Art. 19 of the BR be reflected in CS. The answer to question 15 of the MOEBUS

study suggests that sleep taken on standby is shorter and of poorer quality than normal sleep [Torsvall L & Åkerstedt T, 1988].

**The CFDT France asks to Replace (a)(3) with :** "The minimum the rest period, as established in OR.OPS.355.FTL, following standby duty which does not lead to assignment on a flight duty;"

**Reason:** BR 216/2008 art. 22, 2.(a) request IR based on substantive provisions of Subpart Q EU OPS; *OPS 1.1110 1.1.* establishes that *The minimum rest which must be provided before undertaking a flight duty period starting at home base shall be at least as long as the preceding duty period or 12 hours whichever is the greater;* a crew member can be on standby duty, resting or on duty. Time spent on standby duty cannot be considered as rest, in order to meet this requirement, a minimum rest period has to be guaranteed after concluding a standby duty as scheduled and the following FDP.

**The CFDT asks for a Replacement :** (4)(1)Standby times spent on airport standby are counted for the purposes of cumulative duty hours. (4)(2)How standby spent on standby other than airport standby times are counted for the purposes of cumulative duty hours.

**Reason:** BR 216/2008 art. 22, 2.(a) request IR based on substantive provisions of Subpart Q EU OPS; *OPS 1.1125* establishes that *Airport standby will count in full for the purposes of cumulative duty hours.*

**The CFDT Request regarding (4)(2):** The MOEBUS study suggests in the answer to question 16 that scientific studies on guidelines for the counting of time spent on standby (other than airport standby) would be difficult to undertake; BR 216/2008 art. 192.(a) mandates EASA to issue CS based on national best practices (i.e. UK CAP 371 22.3 Section B Page 14).

**CFDT Request regarding (b)(1) + (2): notified in advance, EASA should issue AMC on the meaning of "notified in advance".**

**Reason:** The term in advance in itself only means before. This in itself does not provide legal certainty. The lack of definition of this item would certainly increase stress and fatigue levels in crew members.

### **OR.OPS.350.FTL Standby duty**

(a) Flight time specification schemes for commercial operators shall specify the following elements for standby duty, where applicable to the type of operation:

- (1) A determination of the maximum length of any standby duty;
- (2) The relationship between standby duty and any assigned flight duty resulting from the standby duty, taking into account facilities available for the crewmember to rest and other relevant factors;
- (3) ~~A determination of the rest period following standby duty which does not lead to assignment on a flight duty;~~
- (4) ~~How standby times are counted for the purposes of cumulative duty hours.~~

(b) Where commercial operators assign crew members to standby duty, the following shall be considered, taking into account the type of operation:

- (1) Standby duty shall be rostered and the affected crew members shall be

notified in advance;

(2) The start and end time of the standby duty shall be defined and the affected crew members shall be notified in advance;

(3) Aerodrome/operating site standby duty shall start from the crew member reporting at the designated normal report point and shall end as notified.

**Request:** regarding (a)(1), CS, issued by EASA, should establish the maximum length of any standby duty.

**Reason:** BR 216/2008, art. 22 2.(a): Latest scientific and technical evidence have to be taken into account; the results of the MOEBUS study have not been able to offer a conclusive result proposing a concrete maximum amount of hours, further medical studies should be commissioned. In the meantime CS should reflect national best practices: Example: The UK CAP 371 proposes a limit of 12 hours for all cases of standby (see 12.4 CAP 371, Section B, page 8).

**Request:** regarding (a)(2), 1.- CS, issued by EASA, should establish that airport standby cannot count as rest and should therefore be considered as FDP in its full extent.

2.- For standby other than airport standby, CS, issued by EASA should propose a formula to calculate the relationship between standby duty and the following FDP. This formula should be based on best national practices (i.e. UK CAP 371 12.4) and latest scientific and technical evidence; the answer to question 15 of the MOEBUS study requests more scientific evaluation of this problem, we therefore call upon EASA to commission further scientific evaluation of this item.

**Reason:** 1.- The MOEBUS study suggests in the answer to question 14: ... we know of no scientific evidence to suggest that airport standby should be considered as any less fatiguing than flight duty..., leading to the conclusion that it should be considered as FDP.

2.- Existing national regulations, i.e. UK CAP 371, propose a formula to establish a relationship between standby duty and any assigned flight duty. These can be considered best practices and should therefore as stated in Art. 19 of the BR be reflected in CS. The answer to question 15 of the MOEBUS study suggests that sleep taken on standby is shorter and of poorer quality than normal sleep [Torsvall L & Åkerstedt T, 1988].

**Replace (a)(3):** The minimum the rest period, as established in OR.OPS.355.FTL, following standby duty which does not lead to assignment on a flight duty;

**Reason:** BR 216/2008 art. 22, 2.(a) request IR based on substantive provisions of Subpart Q EU OPS; OPS 1.1110 1.1. establishes that *The minimum rest which must be provided before undertaking a flight duty period starting at home base shall be at least as long as the preceding duty period or 12 hours whichever is the greater*; a crew member can be on standby duty, resting or on duty. Time spent on standby duty cannot be considered as rest, in order to meet this requirement, a minimum rest period has to be guaranteed after concluding a standby duty as scheduled and the following FDP.

**Replace:** (4)(1)Standby times spent on airport standby are counted for the purposes of cumulative duty hours. (4)(2)How standby spent on standby other than airport standby times are counted for the purposes of cumulative duty hours.

Reason: BR 216/2008 art. 22, 2.(a) request IR based on substantive provisions of Subpart Q EU OPS; OPS 1.1125 establishes *that Airport standby will count in full for the purposes of cumulative duty hours.*

**Request** regarding (4)(2): The MOEBUS study suggests in the answer to question 16 that scientific studies on guidelines for the counting of time spent on standby (other than airport standby) would be difficult to undertake; BR 216/2008 art. 192.(a) mandates EASA to issue CS based on national best practices (i.e. UK CAP 371 22.3 Section B Page 14).

**Request** regarding (b)(1) + (2): **notified in advance**, EASA should issue AMC on the meaning of "*notified in advance*".

Reason: The term in advance in itself only means before. This in itself does not provide legal certainty. The lack of definition of this item would certainly increase stress and fatigue levels in crew members

comment by: kapers Cabin Crew Union

(a) Flight time specification schemes for commercial operators shall specify the following elements for standby duty, where applicable to the type of operation:

- (1) A determination of the maximum length of any standby duty;
- (2) The relationship between standby duty and any assigned flight duty resulting from the standby duty, taking into account facilities available for the crewmember to rest and other relevant factors;
- (3) ~~A determination of the rest period following standby duty which does not lead to assignment on a flight duty;~~
- (4) ~~How standby times are counted for the purposes of cumulative duty hours.~~

(b) Where commercial operators assign crew members to standby duty, the following shall be considered, taking into account the type of operation:

- (1) Standby duty shall be rostered and the affected crew members shall be **notified in advance**;
- (2) The start and end time of the standby duty shall be defined and the affected crew members shall be **notified in advance**;
- (3) Aerodrome/operating site standby duty shall start from the crew member reporting at the designated normal report point and shall end as notified.

Request: regarding (a)(1), CS, issued by EASA, should establish the maximum length of any standby duty.

Reason: BR 216/2008, art. 22 2.(a): Latest scientific and technical evidence have to be taken into account; the results of the MOEBUS study have not been able to offer a conclusive result proposing a concrete maximum amount of hours, further medical studies should be commissioned. In the meantime CS should reflect national best practices: Example: The UK CAP 371 proposes a limit of 12 hours for all cases of standby (see 12.4 CAP 371, Section B, page 8).

Request: regarding (a)(2), 1.- CS, issued by EASA, should establish that airport standby cannot count as rest and should therefore be considered as FDP in its full extent.

2.- For standby other than airport standby, CS, issued by EASA should propose

a formula to calculate the relationship between standby duty and the following FDP. This formula should be based on best national practices (i.e. UK CAP 371 12.4) and latest scientific and technical evidence; the answer to question 15 of the MOEBUS study requests more scientific evaluation of this problem, we therefore call upon EASA to commission further scientific evaluation of this item.

Reason: 1.- The MOEBUS study suggests in the answer to question 14: ... *we know of no scientific evidence to suggest that airport standby should be considered as any less fatiguing than flight duty...*, leading to the conclusion that it should be considered as FDP.

2.- Existing national regulations, i.e. UK CAP 371, propose a formula to establish a relationship between standby duty and any assigned flight duty. These can be considered best practices and should therefore as stated in Art. 19 of the BR be reflected in CS. The answer to question 15 of the MOEBUS study suggests that sleep taken on standby is shorter and of poorer quality than normal sleep [Torsvall L & Åkerstedt T, 1988].

Replace (a)(3): The minimum the rest period, as established in OR.OPS.355.FTL, following standby duty which does not lead to assignment on a flight duty;

Reason: BR 216/2008 art. 22, 2.(a) request IR based on substantive provisions of Subpart Q EU OPS; *OPS 1.1110 1.1* establishes that *The minimum rest which must be provided before undertaking a flight duty period starting at home base shall be at least as long as the preceding duty period or 12 hours whichever is the greater*; a crew member can be on standby duty, resting or on duty. Time spent on standby duty cannot be considered as rest, in order to meet this requirement, a minimum rest period has to be guaranteed after concluding a standby duty as scheduled and the following FDP.

Replace: (4)(1)Standby times spent on airport standby are counted for the purposes of cumulative duty hours. (4)(2)How standby spent on standby other than airport standby times are counted for the purposes of cumulative duty hours.

Reason: BR 216/2008 art. 22, 2.(a) request IR based on substantive provisions of Subpart Q EU OPS; *OPS 1.1125* establishes that *Airport standby will count in full for the purposes of cumulative duty hours*.

Request regarding (4)(2): The MOEBUS study suggests in the answer to question 16 that scientific studies on guidelines for the counting of time spent on standby (other than airport standby) would be difficult to undertake; BR 216/2008 art. 192.(a) mandates EASA to issue CS based on national best practices (i.e. UK CAP 371 22.3 Section B Page 14).

Request regarding (b)(1) + (2): **notified in advance**, EASA should issue AMC on the meaning of "*notified in advance*".

Reason: The term in advance in itself only means before. This in itself does not provide legal certainty. The lack of definition of this item would certainly increase stress and fatigue levels in crew members.

**Original text:**

(b) (1) Standby duty shall be rostered and the affected crew members shall be notified in advance;

**Suggested new text:**

(1) The affected crew members shall be notified in advance of standby duty and ;

**Comment/suggestion:**

On-demand operators do not roster specific duty types in advance. There is a requirement to notify the crewmember in advance of any type of duty including standby.

comment 2780 comment by: *Civil Aviation Authority of Norway*

Comment to subsection (b)(1): The minimum period in advance should be defined.

comment 2781 comment by: *Civil Aviation Authority of Norway*

Comment to subsection (b)(3): Time spent on evt positioning before standby should be part of the duty period.

comment 2819 comment by: *BALPA*

Our comments made in OR.OPS.050 are also valid here. In addition to these, we believe that a standby conducted at home should not exceed 12 hours in duration.

We also require a relationship be detailed between the amount of time an individual has been on standby relative to the amount of FDP that is available. For example, we see no limit to a practice where an individual has been on standby from 0500, gets called for a Tenerife flight at 1600, only to go off duty at 0300 the following morning - a continuous duty of 22 hours which is fatigue inducing and certainly not safe!!! We feel a FDP should be reduced, and restrictions applied, after a certain timescale has been reached. A rule similar in content to the following needs to be addressed:

If a crewmember is called out from standby to conduct a FDP after completing 6 or more hours standby duty, then the total duty period allowed is the sum of all the time spent on standby and the allowable FDP, reduced by the amount of standby worked in excess of 6 hours.

comment 2950 comment by: *Gregor Rozina*

(a) Flight time specification schemes for commercial operators shall specify the following elements for standby duty, where applicable to the type of operation:  
 (1) A determination of the maximum length of any standby duty;  
 (2) The relationship between standby duty and any assigned flight duty resulting from the standby duty, taking into account facilities available for the crewmember to rest and other relevant factors;  
 (3) ~~A determination of the rest period following standby duty which does not lead to assignment on a flight duty;~~

(4) ~~How standby times are counted for the purposes of cumulative duty hours.~~

(b) Where commercial operators assign crew members to standby duty, the following shall be considered, taking into account the type of operation:

(1) Standby duty shall be rostered and the affected crew members shall be notified in advance;

(2) The start and end time of the standby duty shall be defined and the affected crew members shall be notified in advance;

(3) Aerodrome/operating site standby duty shall start from the crew member reporting at the designated normal report point and shall end as notified.

Request: regarding (a)(1), CS, issued by EASA, should establish the maximum length of any standby duty.

Reason: BR 216/2008, art. 22 2.(a): Latest scientific and technical evidence have to be taken into account; the results of the MOEBUS study have not been able to offer a conclusive result proposing a concrete maximum amount of hours, further medical studies should be commissioned. In the meantime CS should reflect national best practices: Example: The UK CAP 371 proposes a limit of 12 hours for all cases of standby (see 12.4 CAP 371, Section B, page 8).

Request: regarding (a)(2), 1.- CS, issued by EASA, should establish that airport standby cannot count as rest and should therefore be considered as FDP in its full extent.

2.- For standby other than airport standby, CS, issued by EASA should propose a formula to calculate the relationship between standby duty and the following FDP. This formula should be based on best national practices (i.e. UK CAP 371 12.4) and latest scientific and technical evidence; the answer to question 15 of the MOEBUS study requests more scientific evaluation of this problem, we therefore call upon EASA to commission further scientific evaluation of this item.

Reason: 1.- The MOEBUS study suggests in the answer to question 14: ... *we know of no scientific evidence to suggest that airport standby should be considered as any less fatiguing than flight duty...*, leading to the conclusion that it should be considered as FDP.

2.- Existing national regulations, i.e. UK CAP 371, propose a formula to establish a relationship between standby duty and any assigned flight duty. These can be considered best practices and should therefore as stated in Art. 19 of the BR be reflected in CS. The answer to question 15 of the MOEBUS study suggests that sleep taken on standby is shorter and of poorer quality than normal sleep [Torsvall L & Åkerstedt T, 1988].

Replace (a)(3): The minimum the rest period, as established in OR.OPS.355.FTL, following standby duty which does not lead to assignment on a flight duty;

Reason: BR 216/2008 art. 22, 2.(a) request IR based on substantive provisions of Subpart Q EU OPS; OPS 1.1110 1.1. establishes that *The minimum rest which must be provided before undertaking a flight duty period starting at home base shall be at least as long as the preceding duty period or 12 hours whichever is the greater*; a crew member can be on standby duty, resting or on duty. Time spent on standby duty cannot be considered as rest, in order to meet this requirement, a minimum rest period has to be guaranteed after concluding a standby duty as scheduled and the following FDP.

Replace: (4)(1)Standby times spent on airport standby are counted for the purposes of cumulative duty hours. (4)(2)How standby spent on standby other than airport standby times are counted for the purposes of cumulative duty hours.

Reason: BR 216/2008 art. 22, 2.(a) request IR based on substantive provisions of Subpart Q EU OPS; OPS 1.1125 establishes *that Airport standby will count in full for the purposes of cumulative duty hours.*

Request regarding (4)(2): The MOEBUS study suggests in the answer to question 16 that scientific studies on guidelines for the counting of time spent on standby (other than airport standby) would be difficult to undertake; BR 216/2008 art. 192.(a) mandates EASA to issue CS based on national best practices (i.e. UK CAP 371 22.3 Section B Page 14).

Request regarding (b)(1) + (2): **notified in advance**, EASA should issue AMC on the meaning of "notified in advance".

Reason: The term in advance in itself only means before. This in itself does not provide legal certainty. The lack of definition of this item would certainly increase stress and fatigue levels in crew members.

**Proposal:** Amend the title as follows :

« OR.OPS.350.FTL Standby ~~duty~~ »

and replace "standby duty" by "standby" throughout OR.OPS.350

**Justification:** Some forms of standby are not considered as duty and therefore do not lead to a rest. Only aerodrome/operating-site standby are duty periods.

#### **OR.OPS.350.FTL Standby duty**

##### **THE CFDT France ASKS FOR THE FOLLOWING AMENDMENTS**

(a) Flight time specification schemes for commercial operators shall specify the following elements for standby duty, where applicable to the type of operation:

- (1) A determination of the maximum length of any standby duty;
- (2) The relationship between standby duty and any assigned flight duty resulting from the standby duty, taking into account facilities available for the crewmember to rest and other relevant factors;
- (3) ~~A determination of the rest period following standby duty which does not lead to assignment on a flight duty;~~
- (4) ~~How standby times are counted for the purposes of cumulative duty hours.~~

(b) Where commercial operators assign crew members to standby duty, the following shall be considered, taking into account the type of operation:

- (1) Standby duty shall be rostered and the affected crew members shall be notified in advance;
- (2) The start and end time of the standby duty shall be defined and the affected crew members shall be notified in advance;
- (3) Aerodrome/operating site standby duty shall start from the crew member reporting at the designated normal report point and shall end as notified.

**CFDT Request:** regarding (a)(1), CS, issued by EASA, should establish the maximum length of any standby duty.

**Reason:** BR 216/2008, art. 22 2.(a): Latest scientific and technical evidence have to be taken into account; the results of the MOEBUS study have not been able to offer a conclusive result proposing a concrete maximum amount of hours, further medical studies should be commissioned. In the meantime CS should reflect national best practices: Example: The UK CAP 371 proposes a limit of 12 hours for all cases of standby (see 12.4 CAP 371, Section B, page 8).

**Request CFDT:** regarding (a)(2), 1.- CS, issued by EASA, should establish that airport standby cannot count as rest and should therefore be considered

as FDP in its full extent.

2.- For standby other than airport standby, CS, issued by EASA should propose a formula to calculate the relationship between standby duty and the following FDP. This formula should be based on best national practices (i.e. UK CAP 371 12.4) and latest scientific and technical evidence; the answer to question 15 of the MOEBUS study requests more scientific evaluation of this problem, we therefore call upon EASA to commission further scientific evaluation of this item.

**Reason:** 1.- The MOEBUS study suggests in the answer to question 14: ... *we know of no scientific evidence to suggest that airport standby should be considered as any less fatiguing than flight duty...*, leading to the conclusion that it should be considered as FDP.

2.- Existing national regulations, i.e. UK CAP 371, propose a formula to establish a relationship between standby duty and any assigned flight duty. These can be considered best practices and should therefore as stated in Art. 19 of the BR be reflected in CS. The answer to question 15 of the MOEBUS study suggests that sleep taken on standby is shorter and of poorer quality than normal sleep [Torsvall L & Åkerstedt T, 1988].

**The CFDT France asks to Replace (a)(3) with :** "The minimum the rest period, as established in OR.OPS.355.FTL, following standby duty which does not lead to assignment on a flight duty;"

**Reason:** BR 216/2008 art. 22, 2.(a) request IR based on substantive provisions of Subpart Q EU OPS; *OPS 1.1110 1.1.* establishes that *The minimum rest which must be provided before undertaking a flight duty period starting at home base shall be at least as long as the preceding duty period or 12 hours whichever is the greater;* a crew member can be on standby duty, resting or on duty. Time spent on standby duty cannot be considered as rest, in order to meet this requirement, a minimum rest period has to be guaranteed after concluding a standby duty as scheduled and the following FDP.

**The CFDT asks for a Replacement :** (4)(1)Standby times spent on airport standby are counted for the purposes of cumulative duty hours. (4)(2)How standby spent on standby other than airport standby times are counted for the purposes of cumulative duty hours.

**Reason:** BR 216/2008 art. 22, 2.(a) request IR based on substantive provisions of Subpart Q EU OPS; *OPS 1.1125* establishes that *Airport standby will count in full for the purposes of cumulative duty hours.*

**The CFDT Request regarding (4)(2):** The MOEBUS study suggests in the answer to question 16 that scientific studies on guidelines for the counting of time spent on standby (other than airport standby) would be difficult to undertake; BR 216/2008 art. 192.(a) mandates EASA to issue CS based on national best practices (i.e. UK CAP 371 22.3 Section B Page 14).

**CFDT Request regarding (b)(1) + (2): notified in advance, EASA should issue AMC on the meaning of "notified in advance".**

**Reason:** The term in advance in itself only means before. This in itself does not provide legal certainty. The lack of definition of this item would certainly increase stress and fatigue levels in crew members.

comment by: ANE (Air Nostrum) OPS QM

OR.OPS.350.FTL. Imaginaria.

o It is recommended to define how standby times are counted for the purpose of cumulative hours. Well, we just are using home standby duties, so:

§ If a home standby is not called to operate any flight, they will count as 0 for cumulative hours

§ If a home standby is called to operate, the new duty scheduled is the only duty time that will count for purpose of cumulative hours

Recent EASA presentations regarding options for future FTL scheme for CAT operations [RM task OPS 055] means this section remains under review. A lack of response at this time should not be interpreted as tacit acceptance of Section VIII. We reserves the right to come back to EASA on Section VIII once the options issue has been settled. We understand that the Agency are planning separate Rule making activity in regard to FTL and wish to re-iterate that we would welcome Industry participation.

**C. III. Draft Opinion Part-OR - Subpart OPS - Section VIII - Chapter 3 -  
OR.OPS.355.FTL Rest periods**

p. 30

comment 264 comment by: *ECA - European Cockpit Association*

Comment on OR.OPS.355.FTL:

Introduce scientific evidence based figures :

(a) 10 hours

(b) 8 hours, plus allowance for time zone effect

(d) 36 hours including 2 local nights within any 7 consecutive days

Justification:

These figures have been clearly scientifically demonstrated (Moebus Study). There is no safety related reason to exclude them from IR level. See also other related ECA comments.

comment 400 comment by: *Ryanair*

**OR.OPS.355.FTL (a) – Rest Periods**

**Comment**

Any differentiation between rest requirements applicable at a home base versus away from home base has no basis in safety and must be removed.

**Proposal**

The minimum rest period provided before undertaking a flight duty period shall be at least as long as the preceding duty period, or 10 hours, whichever is greater.

**OR.OPS.355.FTL (b) – Rest Periods**

**Comment**

The requirement to provide a sleep opportunity before undertaking a flight duty is addressed in minimum rest requirements

**Proposal**

DELETE

**OR.OPS.355.FTL (b) & (c) – Rest Periods**

**Comment**

The requirement for an operator to specify a sleep opportunity is not required as this issue is addressed in minimum rest and OR.OPS.010.FTL – 'Definitions (l) – Positioning' which sets out the requirements for travel time to/from a place of rest.

**Proposal**

DELETE (b) & (c)

**OR.OPS.355.FTL (d) – Rest Periods****Comment**

The wording used in this requirement is not compatible with CS FTL 1.155 (c)

**Proposal**

Recurrent extended recovery rest periods to compensate for cumulative fatigue

comment 733

comment by: *Luftfahrt-Bundesamt*

The LBA does not agree to move EU-OPS in a CS, due to its legal uncertainty, even when the Basic Regulation asks for a CS.

We herewith request to establish a clear legal situation by keeping the FTL – Requirements in the Implementing Rules.

The FTL rules as proposed do not include requirements for corporate operations with non-complex motor powered aircraft. This is not acceptable as pilots of these aircraft deserve the same protection against fatigue as their colleagues in larger aircraft.

Justification: see LBA - General Comment, reasons 1 and 2

comment 1105 comment by: *AEA*

**Relevant Text:** Chapter 1 (General Requirements) of Section VIII (**new para**)

**Comment:** The rest requirements (OR.OPS.355.FTL) for commercial operators should also apply to non-commercial operators in order to ensure a fair competition with non-commercial operators which are indirectly competing with commercial operators when transporting certain types of passengers or freight. For safety reason, all type of operations of complex aeroplanes should be subject to identical rules.

**Proposal:** Introduce a new OR.OPS.055 Rest Periods into the Chapter 1 (general requirements) related to FTL and rest requirements, based on OR.OPS.355.FTL (Rest Period applicable to commercial operators)

comment 1110

comment by: *AEA***Relevant Text:**

Entire paragraph OR.OPS.355.FTL

**Comment:**

The **reduced rest provisions** of EU-OPS are missing in the implementing rules.

**Proposal:**

Re-introduce the reduced rest provisions of EU-OPS through adding to OR.OPS.355.FTL a new point after point (a) '**Notwithstanding (a) provisions of reduced rest arrangements**'.

comment 1118

comment by: *AEA***Relevant Text:**

(a) Minimum rest periods in relation to the preceding duty period, which must be provided before undertaking a flight duty period either from home base or

away from home base

**Comment:**

This requirement this not include the possibility of 'back-to-back' operations e.g. with 10h rest at the nominated home base as long as rest facilities are provided

**Proposal:**

Add the possibility to apply the 'away from home base' rest provisions at the home base as long as rest facilities are provided through **adding to (a)**: '*As long as rest facilities are provided, the away from home base rest provisions can be applied at the home base*'.

comment 1148 comment by: ECA - European Cockpit Association

Comment on OR.OPS.355.FTL(a):

This section should be called "*Flight time specification schemes - rest*"

and be moved to fit in with OR.OPS.330.FTL and OR.OPS.335.FTL so that all regulation on "*Flight time specification schemes*" are assembled in one unit.

comment 1149 comment by: ECA - European Cockpit Association

Comment on OR.OPS.355.FTL(a):change as follows:

Minimum rest periods in relation to the preceding duty period, which must be provided before undertaking a flight duty period starting either from home base or away from home base **taking into account any duty assigned in between the rest and the flight duty;**

Justification:

The wording as given allows an operator to assign no-flying duty in between the rest and the succeeding flight duty without a limiting effect on the length of the flight duty.

The so called mixed duties must be regulated at another position to appropriately address the fatiguing effect of any duty and its impact on flight safety. There is no comprehensive argument why any other duty should be considered as any less fatiguing than flight duty.

**Question 8** (Moebus Study): answer:

Reduced rest is only allowed as part of a comprehensive FRMS and that FRMS would need take into account of a wide range of factors including both the time spent commuting and the influence of the body clock on sleep duration.

comment 1151 comment by: ECA - European Cockpit Association

Comment on OR.OPS.355.FTL(b):add as follows:

(b) Sleep opportunity before undertaking a flight duty period starting away from home base, depending on the preceding duty period; **any reduced rest that is less than 12 hours long should include the entire WOCL period, and consideration should be given to ensuring that the subsequent flight duty is not too onerous.**

Justification:

This is a recommendation by the Moebus Study.

comment

1152

comment by: ECA - European Cockpit Association

Comment on OR.OPS.355.FTL(c):

Add provision for additional rest following extensions as per answer to question 7 of Moebus study (see below).

According to the answer to **Question 7** from the scientific evaluation, the minimum rest during layovers should be 14 hours after significant time crossings.

Justification:

More detailed regulation on extended rest after a transition through a significant number of time zones is required.

The scientific evaluation's recommendation for TZC of more than 2 zones within one FDP:

(1) Rest on layover min. 14 hrs.

(2) Recovery at home base according to Moebus table.

In case of return flight in WOCL (home base time): at least 2 local nights should be provided.

Furthermore, add the concept of acclimatization to the regulation and additional restrictions related to rest on layover and recovery at home base, in particular to take into account acclimatization.

comment

1153

comment by: ECA - European Cockpit Association

Comment on OR.OPS.355.FTL(d):add as follows:

(d) Weekly recurrent extended recovery rest periods to compensate for cumulative fatigue. **A weekly rest period is essential to allow the dissipation of the cumulative fatigue.**

**A weekly rest:**

**- encompasses two local nights**

**- will be scheduled at least 4 times per any 28 days and at not less than 168 hours apart**

**- will be appropriately extended after a time zone transition for the purpose of acclimatization.**

Justification:

As it is unlikely that a weekly rest will fully dissipate fatigue if it does not encompass two local nights, will not occur at a sufficient rate per month or occurs after a rapid time zone transition, the proposed minimum requirement shall be observed.

The following principles from the scientific review shall be observed:

**Question 9**

*Removing the "exemption" given in OPS 1.1110 2.1 for the second local night (which currently allows reporting time as early as 04:00, resulting in aircrew starting their week of consecutive duty periods in a fatigued state).*

**Question 10**

*defining local nights as a period of 10 hours falling between 22:00 and 10:00.  
... requiring four weekly rest periods in every 28 consecutive days*

comment 1211 comment by: *Sven Freisenich*

The reduced rest provisions of EU-OPS are missing and have been downgraded to certification specifications. LTU proposes to re-introduce the reduced rest provisions of EU-OPS.

comment 1474 comment by: *M Wilson-NetJets*

**Original text:**

OR.OPS.355.FTL Rest periods

Flight time specification schemes for commercial operators shall specify the following rest elements, where applicable to the type of operation:

- (a) Minimum rest periods in relation to the preceding duty period, which must be provided before undertaking a flight duty period starting either from home base or away from home base;
- (b) Sleep opportunity before undertaking a flight duty period starting away from home base, depending on the preceding duty period;
- (c) Additional rest periods to compensate for the effects of time zone differences and extensions of the FDP;
- (d) Weekly recurrent extended recovery rest periods to compensate for cumulative fatigue.

**Suggested new text:**

OR.OPS.355.FTL Rest periods

Flight time specification schemes for commercial operators shall specify the following rest elements, where applicable to the type of operation:

- (a) Minimum rest periods in relation to the preceding duty period, which must be provided before undertaking a flight duty period;
- (b) Make due allowance for an increase in rest if this rest is taken at the crew members normal residence to allow for unavoidable day to day activities that could reduce the normally available rest time;
- (c) Sleep opportunity before undertaking a flight duty period, depending on the preceding duty period;
- (c) Additional rest periods to compensate for the effects of time zone differences and extensions of the FDP;
- (d) Weekly recurrent extended recovery rest periods to compensate for cumulative fatigue.

**Comment/suggestion:**

Home base is centralized operator concept and to allow other types of operations (mainly decentralized) to be able to devise the most flexible, safe and economically advantageous FTL schemes the requirement to specify different rest periods for FDPs starting from home base or away from the home base should be moved to the CS or AMC part of the regulation.

comment 1475 comment by: *M Wilson-NetJets*

**Original text:**

(d) Weekly recurrent extended recovery rest periods to compensate for cumulative fatigue.

**Suggested new text:**

(d) Extended recovery rest periods to compensate for cumulative fatigue.

**Comment/suggestion:**

Different operations cause different levels of accumulation of fatigue over a certain time periods. Therefore, also the extended recovery periods differ for each type of operation. To allow other types of operations to be able to devise the most flexible, safe and economically advantageous FTL schemes the weekly requirement to schedule extended rest periods should be moved to the CS or AMC part of the regulation.

comment

comment by: *British Airways*

(b) We seek further clarification on the definition of a sleep opportunity and how does this relate to circadian rhythms?

(c) Remove this statement. We feel that our existing rest rules that require a minimum of 12hrs rest or a rest as long as the preceding duty is sufficient.

(d) Remove the word 'weekly'. This does not add anything to the context of this sentence. Also later items refer to 168hrs and not weekly, therefore confusion as to what should be applied could result.

comment by: Jill Pelan

**OR.OPS.355.FTL Rest periods****The CFDT France asks for the following changes :**

Flight time specification schemes for commercial operators shall specify the following rest elements, where applicable to the type of operation:

- ~~(a) Minimum rest periods in relation to the preceding duty period, which must be provided before undertaking a flight duty period starting either from home base or away from home base;~~
- ~~(b) Sleep opportunity before undertaking a flight duty period starting away from home base, depending on the preceding duty period;~~
- (c) Additional rest periods to compensate for the effects of time zone differences and extensions of the FDP;
- ~~(d) Weekly recurrent extended recovery rest periods to compensate for cumulative fatigue.~~

**Replace:** (a) (1) Minimum rest period at home base.

The minimum rest period provided before undertaking a flight duty period starting at home base is at least as long as the preceding duty period, or 12 hours, whichever is the greater.

(2) Minimum rest period away from home base.

The minimum rest period provided before undertaking a flight duty period starting away from home base is at least as long as the preceding duty period, or 10 hours, whichever is the greater.

**Reason:** Minimum rest and the definition of its duration have to be considered a substantive provision of Subpart Q EU OPS and have therefore to be included in the IR. (Art. 22 2.(a) BR 216/2008).

**Replace:** (b) The minimum rest period away from home base includes an 8 hour sleep opportunity taking account of travelling and other physiological needs, which has to be increased accordingly depending on the preceding duty period;

**Reason:** The definition of an 8 hour sleep opportunity seems a logical conclusion following the established 10 hours minimum rest and allowing for travel time to the place of rest, time to eat, bathe and other physiological needs. The US Federal Motor Carrier Safety Administration recommends a minimum of 8 hours of uninterrupted sleep per day for drivers.

**Request regarding (c): Art. 19 2.(a)** mandates EASA to develop CS reflecting "*best practices and scientific and technical knowledge*". When drafting these CS the Agency should at least take the following criteria into account:

The definition of significant time-zone crossing: significant time-zone crossing is considered to cover more than two time zones within one FDP [Roach GD et al, 2002; Kantermann T et al, 2007].

The minimum rest away from home base shall be increased to allow for additional resting time when the normal sleep time on the body clock does not overlap with the normal sleep time in the local environment at destination.

Additional rest on return to home base depending on the maximum time zone difference and preceding layover length, taking into account the recommendations made by MOEBUS in the answer to question 7 and national best practices. If time-zone crossing in one direction is followed by

time-zone crossing in the opposite direction the additional rest at home base should be increased by an additional local night at home base.

**Replace: (d)** A weekly recurrent extended recovery rest of at least 36 hours to compensate for cumulative fatigue, including two local nights, such that there are never more than 168 hours between the end of one recurrent extended recovery rest period and the start of the next.

*Reason:* BR 216/2008 Art. 22, 2. (a): The weekly extended recovery rest is to be considered a substantive provision of Subpart Q EU OPS and has therefore to be included in **IR**, taking into account the latest scientific and technical evidence.

comment by: Gregor Rozina

Flight time specification schemes for commercial operators shall specify the following rest elements, where applicable to the type of operation:

~~(a) Minimum rest periods in relation to the preceding duty period, which must be provided before undertaking a flight duty period starting either from home base or away from home base;~~

~~(b) Sleep opportunity before undertaking a flight duty period starting away from home base, depending on the preceding duty period;~~

(c) Additional rest periods to compensate for the effects of time zone differences and extensions of the FDP;

~~(d) Weekly recurrent extended recovery rest periods to compensate for cumulative fatigue.~~

Replace: (a) (1) Minimum rest period at home base.

The minimum rest period provided before undertaking a flight duty period starting at home base is at least as long as the preceding duty period, or 12 hours, whichever is the greater.

(2) Minimum rest period away from home base.

The minimum rest period provided before undertaking a flight duty period starting away from home base is at least as long as the preceding duty period, or 10 hours, whichever is the greater.

Reason: Minimum rest and the definition of its duration have to be considered a substantive provision of Subpart Q EU OPS and have therefore to be included in the IR. (Art. 22 2.(a) BR 216/2008).

Replace: (b) The minimum rest period away from home base includes an 8 hour sleep opportunity taking account of travelling and other physiological needs, which has to be increased accordingly depending on the preceding duty period;

Reason: The definition of an 8 hour sleep opportunity seems a logical conclusion following the established 10 hours minimum rest and allowing for travel time to the place of rest, time to eat, bathe and other physiological needs. The US Federal Motor Carrier Safety Administration recommends a minimum of 8 hours of uninterrupted sleep per day for drivers.

Request regarding (c): Art. 19 2.(a) mandates EASA to develop CS reflecting best practices and scientific and technical knowledge. When drafting these CS the Agency should at least take the following criteria into account:

The definition of significant time-zone crossing: significant time-zone crossing is considered to cover more than two time zones within one FDP [Roach GD et al, 2002; Kantermann T et al, 2007].

The minimum rest away from home base shall resting time when the normal sleep time on the body clock does not overlap with the normal sleep time in the local environment at destination.

Additional rest on return to home base depending on the maximum time zone difference and preceding layover length, taking into account the recommendations made by MOEBUS in the answer to question 7 and national best practices. If time-zone crossing in one direction is followed by time-zone crossing in the opposite direction the additional rest at home base should be increased by an additional local night at home base.

Replace: (d) A weekly recurrent extended recovery rest of at least 36 hours to compensate for cumulative fatigue, including two local nights, such that there are never more than 168 hours between the end of one recurrent extended recovery rest period and the start of the next.

Reason: BR 216/2008 Art. 22, 2. (a): The weekly extended recovery rest is to be considered a substantive provision of Subpart Q EU OPS and has therefore to be included in IR, taking into account the latest scientific and technical evidence;

comment 3073

comment by: BALPA

Section (a) identifies the rest requirement "...before undertaking a *flight duty period*..". This doesn't seem to take into consideration ground duties. Therefore, can a standby that is unused be followed by another standby starting, for example, 4 hours later? If so, this is blatantly nowhere near the minimum rest requirement between two flying duties so what's the difference between flying and ground duties! Our concern highlighted in OR.OPS.050 FTL regarding the definition of "designated" rest periods is again raised. This needs to be clarified carefully to ensure safety is upheld.

comment 3169

comment by: DGAC

**Proposal:** Amend the paragraph by adding a new items (e) as follows :

"(e) Conditions for reduction of the minimum rest, taking into account:

- (1) the number and length of sectors flown;
- (2) the number of time zones crossed;
- (3) a limit under which the minimum rest can not be reduced;
- (4) FDPs within the WOCL;
- (5) a maximum number of reductions for a consecutive number of days;
- (6) reduction of the following FDP
- (7) increased pre- and post-flight minimum rest periods;

**Justification:** All items of EU-OPS mentioned in article 8.4 of Regulation (EEC) No 3922/91 can find a legal hook<sup>(\*)</sup> in OR.OPS.FTL except reduced rest which seems to have been forgotten. The proposal will reintroduce that hook.

(\*) "8.4. Notwithstanding the provisions of paragraphs 1, 2 and 3, a Member State may adopt or maintain provisions relating to

o OPS 1.1105 point 6, [= > **(5) of OR.OPS.335.FTL**]

o OPS 1.1110 points 1.3 [= > **(c) of OR.OPS.355.FTL**]

o and 1.4.1, [= > **add a new (e) to OR.OPS.355.FTL**]

o OPS 1.1115, [= > **(6) of OR.OPS.335.FTL**]

o and OPS 1.1125 point 2.1 [= > **OR.OPS.350.FTL**]

of Subpart Q in Annex III until Community rules based on scientific knowledge and best practices are established."

OR.OPS.020.SEC

The term "potentially disruptive passenger" in the context of Regulation (EC) 300/2008 means a "passenger who is either a deportee, a person deemed to be inadmissible for immigration purposes, or a person in lawful custody".

Although we cannot find any definition of the term "disruptive passenger" in Regulation 216, it is clear that this term is used in a much wider context. This anomaly must be addressed and any confusion removed.

Security training requirements are already specified in and mandated by Regulation (EC) 300/2008.

comment 2689

comment by: AUSTRIAN Airlines

Potentially Disruptive passengers are also covered by the provisions on EU300/2008 Chapter 4 Passengers and Cabin Baggage This must be recognised as either the responsibility for regulatory authority and activity for SAFETY (EASA) or Security (DG TREN) and definitions harmonised.

comment 2732

comment by: easyjet safety

easyJet believes that aviation **security** measures are within the competence, and should remain the sole remit of European Commission DG TREN F5 and should not be confused by those **safety** measures under the responsibility of DG TREN F.3 / EASA.

The term 'potentially disruptive passenger' in the context of Regulation (EC) 200/2008 means a "passenger who is a deportee, a person deemed to be inaccessible for immigration purposes or a person in lawful custody". Although not defined in Regulation 216, it is clear that the term 'disruptive passenger' is used in a much wider context. This anomaly must be clarified and any confusion removed. Disruptive passengers (actual) are both a safety and security risk.

comment 3170

comment by: DGAC

There is a (b) missing for non commercial operators of complex motor-powered aircraft, or the provisions in (a) should be applicable to both commercial operators and non commercial operators of complex motor-powered aircraft.

Indeed the essential requirements of the basic regulation (art 8.c of annexe IV) state the following :

"8. Additional requirements for operation for commercial purposes and operation of complex motor-powered aircraft

8.c. The operator must establish procedures, as appropriate, so as to minimise the consequences to safe flight operations of disruptive passenger behaviour."

If the choice is to keep one paragraph to both, then delete "(a)" and renumber (1) and (2) into (a) & (b).

paragraph 62 of NPA 2009-02 A refers to a paragraph "(b) training and procedures" "based on the implementation of applicable ICAO SARPS with regard to training and procedures (subparagraph b)."

comment 3361 comment by: *BDF - German Airline Association*

In conjunction with OR.OPS.025.SEC the requirement of staff training is doubled. Regulation (EC) 200/2008, Chapter 11 of the Annex, the Commission Regulation (EC) 272/2009, and the forthcoming Commission Regulation laying down detailed measures for the implementation of the common basic standards on aviation security already cover the training issue. Provisions are laid down in Chapter 4 of the annex of Regulation (EC) 300/2008. This must be therefore recognized as the responsibility for regulatory authority for the Commission.

comment 3440 comment by: *Swedish Transport Agency, Civil Aviation Department (Transportstyrelsen, Luftfartsavdelningen)*

**Comment:**

Regulation (EC) No 300/2008 provides the basis for a common interpretation of ICAO Annex 17.

According to Regulation (EC) No 300/2008 article 10 all Member States shall draw up, apply and maintain a National Civil Aviation Security Programme. This programme shall be made available in appropriate parts to operators and entities concerned. The programme shall define responsibilities for the implementation of the common basic standards and describe the measures required by operators. The common basic standards consists of a large variety of security measures and includes both inflight security measures and training. The detailed implementing legislation are at present being prepared by the Commission in cooperation with Member States. Regulation (EC) No 300/2008 also requires air carriers to draw up, apply and maintain an air carrier security program.

Considering the above we find it inappropriate and unpractical to single out a few security related issues and regulate them in the flight safety context. We have absolutely no objections of regulating the issues per se, but they should be dealt with in the same context as all other security issues. We believe that this view is also shared by most stake holders.

**Proposal:**

All security issues related to ICAO Annex 17 should be left to be dealt with in the implementing legislation of Regulation (EC) No 300/2008.

comment 3935 comment by: *IATA*

Editorial Paragraph (b)

Subservient paragraphs should be numbered (1) and (2).

comment

318

comment by: ECA - European Cockpit Association

This paragraph should be deleted. ECA believes the provisions of the security section should be deleted as they overlap with Regulation 300/2008 (see comment n° 316). If, however it is decided to keep this section within OPS, the following changes are needed:

(a) An operator ~~of a complex motor-powered aircraft~~ shall develop and implement a security programme **appropriate to its operation**. The security programme shall comply with the relevant requirements of the national civil aviation security programme of the competent authority in the State of the operator. Appropriate elements of the security programme shall be included in the operations manual. The operator shall ensure that crew members have knowledge of and competence in all relevant elements of the security programme.

(b) ~~A commercial operator or a non-commercial operator~~ **Any operator of complex motor-powered aircraft** shall establish, maintain and implement a security training programme, **appropriate for the operation**, which:

(a) ensures that crew members ~~act in the most appropriate manner~~ **make every effort** to prevent acts of unlawful interference, and to minimise the consequences of such events should they occur;

(b) includes ~~s sections in the syllabus on security training programmes regarding~~ **sections in the syllabus on security training programmes regarding** disruptive passengers and acts of unlawful interference.

Justification:

(comment on (a)) The definition of regulation 300/2008 should be included.

(comment on (b)) ECA strongly recommends to delete. This obligation exists already under R300. This duplicity creates confusions and concepts are diffused. Include the definition of Regulation 300/2008. 'Most appropriate manner' does not take into account the circumstances of the event. The proposed formulation is more appropriate.

comment

 Security Programmes and Security training is a basic requirement of Regulation (EC) 300/2008. First of all the EASA NPA doubles these requirements, but secondly it is only applicable to air transport operators. Regulation (EC) 300/2008 also reflects the need of an airport for having a security programme, since security already starts at an earlier point than the flight itself. The same applies to the training programme. Former regulations reflected the compatibility of training programmes with the National Aviation Security Programme. This is completely left out of the EASA NPA.

 R300/2008 does not only deal with "search procedure" but with « check and search procedure »  
 Moreover the draft Implementing Legislation establishes in the general provisions of Chapter 3 "Aircraft Security"(§3.0.3) that « an aircraft need not to be subjected to an aircraft security search. It shall be subjected to an aircraft security check in accordance with § 3.1". The checklist concerning aircraft security checks is attachment 3.b to Chapter 3.  
 Therefore, "security search" might be replaced all over section IX by "security check"

b) **Approved cockpit door**  
Wording should align with ICAO Annex 6

comment 1301

comment by: UK CAA

**Page No:** 31 of 136

**Paragraph No:**  
OR.OPS.035.SEC (c)(1)

**Comment:**

The requirement to close and lock an approved flight deck door should be amended to "prior to engine start".

**Justification:**

Whilst the wording aligns with ICAO Annex 6 there appears to be no other justification for the change. EU-OPS uses 'prior to engine start' as the moment for the door to be locked. This permits flexibility for the crew when an aircraft closes the doors but has to wait a significant amount of time before starting engines. Existing Standard Operating Procedures are predicated on the EU-OPS requirement and the procedure has worked well.

**Proposed Text (if applicable):**

"be closed and locked prior to engine start until engine shut down, except when necessary to permit access and egress by authorised persons."

The programme shall define responsibilities for the implementation of the common basic standards and describe the measures required by operators. The common basic standards consists of a large variety of security measures and includes both inflight security measures and training. The detailed implementing legislation are at present being prepared by the Commission in cooperation with Member States. Regulation (EC) No 300/2008 also requires air carriers to draw up, apply and maintain an air carrier security program.

Considering the above we find it inappropriate and unpractical to single out a few security related issues and regulate them in the flight safety context. We have absolutely no objections of regulating the issues per se, but they should be dealt with in the same context as all other security issues. We believe that this view is also shared by most stake holders.

**Proposal:**

All security issues related to ICAO Annex 17 should be left to be dealt with in the implementing legislation of Regulation (EC) No 300/2008.

comment 3760 comment by: *Embraer - Indústria Brasileira de Aeronáutica - S.A.*

The requirement OR.OPS.035.SEC(c)(2) is not clear of how it is expected to be complied. An Acceptable Means of Compliance or Guidance Material item should be added in order to clarify the required procedures/equipment to meet the requirement intent.

comment 3824 comment by: *IACA International Air Carrier Association*

(c)(2)

There is no AMC for this IR. Does this paragraph preclude an alternative means when the CCTV is U/S ? Does EASA intend this to be an MEL release item ? That would be excessive and unnecessary. Alternative means are already established as good practice in the event that the CCTV is u/s.

Add:

(3) An alternative means should be provided in the event that the /CCTV is unserviceable to monitor the area outside the cockpit to identify persons requesting to entry and to detect suspicious behaviour or potential threat.

comment 3938 comment by: *IATA*

With the exception of certification requirements for anti intrusion reinforced cockpit doors (where required to be fitted), aircraft cockpit security should be included in Chapter 10 of EU300/2008.

comment 3991 comment by: *ANE (Air Nostrum) OPS QM*

**Ref. OR.OPS.035.SEC Cockpit security – Aeroplanes**

c) The cockpit door referred to in subparagraph (b) above shall:

1) be closed and locked from the time all external doors are closed following **embarkation** until any such door is opened for **disembarkation**, except when necessary to permit access and egress by authorised persons; and

This is at variance to EU OPS 1 where the cockpit door is required to be locked before the **engine s tart** until it is **shut down**. This definition is more operationally suitable e.g. technical or ATC delays with passengers on board etc. and does not affect security. We request re word paragraph 1):

*1) 1 ) be closed and locked from engine start until engine shut down, except when necessary to permit access and egress by authorised persons; and'*

**C. III. Draft Opinion Part-OR - Subpart OPS - Section IX - OR.OPS.040.SEC  
Cockpit security – Helicopters**

p. 31-32

comment 321 comment by: *ECA - European Cockpit Association*

Comment on OR.OPS.040.SEC:

This paragraph should be deleted.

**~~If installed, the cockpit door on a helicopter operated for the purpose of carrying passengers shall be capable of being locked from within the~~**

**cockpit in order to prevent unauthorised access.**

Justification:

ECA believes the provisions of the security section should be deleted as they overlap with Regulation 300/2008 (see comment n° 316). Besides, this is not applicable to helicopters. If helicopters ditch, there is the possibility that the door could not be opened.

General comments

EASA seems to have taken an approach to downgrade the hard-time limits of Subpart Q of EU-OPS into Certification Specifications. The hard-time limits of Subpart Q provided for a minimum level of harmonisation at EU level and should remain part of the Implementing Rule. This is essential to ensure a level playing field within the EU market. Moreover, the EU Legislator clearly spelled out in the Basic Regulation not to change EU-OPS Subpart Q which was only implemented on 16<sup>th</sup> July 2008.

The EASA proposal to remove limits from hard law to CSs is intended to provide for flexibility to suit different kinds of operations. But, until EASA confirmed themselves as an independent safety regulator, LTU prefers to maintain the technical content of EU-OPS in the Implementing Rule. The need for any rulemaking activity shall be identified in a safety case and supported by a correct regulatory impact assessment; and not be biased and/or influenced by social considerations.

Alternative CS for Short/Medium Haul Operations attached

*NPA 200902c  
30 Jan 2009*

**IV. DRAFT DECISION CS TO PART – ORGANISATION REQUIREMENTS  
(PART OR)**

**Certification Specifications (CS) to Part OR****Subpart OPS – Air Operations****Section VIII – Flight and duty time limitations and rest requirements****CS FTL Short/Medium Haul****CS FTL.2 Basic Certification Specification for Commercial Air Transport (Aeroplanes) Short/Medium Haul Operations****CS FTL.2.100 Applicability**

CS FTL.2 constitutes a flight time specification scheme in accordance with OR.OPS.330.FTL and is applicable for commercial air transport operations (aeroplanes) in conjunction with the applicable requirements for flight and duty time limitations and rest requirements. Qualifying Operators shall satisfy the following criteria:

Short/medium haul operations.  
 No planned overnights.  
 No through the night flying.  
 Limited consecutive duty days.  
 Blocks of consecutive days free of duty (day off)  
 No time zone considerations (crew start and finish FDP in the same time zone).  
 Fixed early start/late start roster pattern.

**Definitions:**

For the purpose of this Certification Specification, the following definitions shall apply:

- (a) Short/medium haul operations – in excess of one sector planned to be completed within a single FDP and normally planned to start and finish at the same home base.
- (b) Fixed Roster – planned duty periods, flight duty periods, rest periods and blocks of consecutive days free of duty published 28 days in advance and updated 7 days in advance (note: last minute changes to duties may occur within the fixed roster pattern).
- (c) Through the night flying – FDP's that fully encompass the WOCL.
- (d) Early start – FDP starting before 11.00L
- (e) Late Start – FDP starting after 11:00L
- (f) Calendar year – fixed 12 calendar months e.g. 1<sup>st</sup> April to 31<sup>st</sup> March
- (g) Week – A 7 day period commencing at 00.00 on a Monday and finishing at 23.59 on the following Sunday, being a period of 168 hours.

**CS FTL.2.135 Maximum daily Flight Duty Period (FDP)**

- (a) Maximum daily FDP without the use of extensions.

The maximum daily FDP shall be 13 hours. These 13 hours shall be reduced by 30 minutes for each sector from the third sector onwards with a maximum total reduction of two hours.

Operators may, on the basis of scientific analysis, operational experience and with the approval of the Competent Authority may permanently move the penalties associated with the WOCL by +/- 60 minutes. This shall be referred to as an 'operator approved WOCL'.

Where the FDP starts in the Operator approved WOCL the maximum stated above will be reduced by 100% of its encroachment up to a maximum of 2 hours.

When the FDP ends or fully encompasses the Operator approved WOCL the maximum FDP stated above will be reduced by 50% of the encroachment.

(b) Maximum daily FDP with the use of extensions.

The maximum daily FDP can be extended by up to one hour subject to the restrictions below:

Extensions are not allowed for a basic FDP of 6 sectors or more.

Where the FDP encroaches on the operator approved WOCL by less than 2 hours extensions are limited to a maximum of 4 sectors.

Where the FDP encroaches on the operator approved WOCL by more than 2 hours extensions are limited to a maximum of 2 sectors.

The maximum number of extensions shall be 2 in any week.

Where an FDP is planned to use an extension pre and post flight minimum rest is increased by 2 hours or post flight rest only is increased by 4 hours.

Where an extension is used for consecutive FDPs the post and pre flight rest between the two operations shall run consecutively.

Where an FDP starts in the period 22.00 to 04.49 the FDP shall be limited to 11.45hrs.

(c) FDP with different reporting time for flight crew and cabin crew

In cases where cabin crew require more time than the flight crew for their pre-flight briefing for the same flight or series of flights, the FDP of the cabin crew may be extended by the difference in reporting time between the cabin crew and the flight crew, as long as the difference does not exceed 60 minutes.

### **CS FTL.2.140 Flight times and duty periods**

(a) The total duty periods to which a crew member is assigned shall not exceed:

- (1) 60 duty hours in any week
- (2) 190 duty hours in any 28 consecutive days.

(b) The total block time of the flights on which an individual crew member is assigned as an operating crew member shall not exceed:

- (1) 100 block hours in any 28 consecutive days;
- (2) 900 block hours in any calendar year.

(c) The total duty periods and total flight times referred to in (a) and (b)

above should be spread as evenly as practicable throughout their respective periods.

#### **CS FTL.1.155 Minimum Rest Period**

(a) Minimum rest period

The minimum rest period provided before undertaking a flight duty period shall be at least as long as the preceding duty period, or 10 whichever is the greater.

(b) Recurrent extended recovery rest periods

The minimum recurrent extended recovery rest period to compensate for cumulative fatigue is a 36 hour period including two local nights, such that there are never more than 168 hours between the end of one recurrent extended recovery rest period and the start of the next. The second of those local nights may start from 20.00hrs if the weekly rest period has a duration of at least 40 hours.

#### **CS FTL.1.160 Un foreseen circumstances in actual flight operations – discretion by the pilot in command**

(a) The conditions for the modification of the limits on flight duty, duty and rest periods by the pilot in command in the case of unforeseen circumstances in actual flight operations, and after the reporting time, should comply with the following:

(1) The maximum basic daily FDP which results after applying CS FTL.1.135 (b) and

(c) may not be increased by more than two hours unless the flight crew has been augmented, in which case the maximum flight duty period may be increased by not more than 3 hours;

(2) The maximum basic daily FDP which results after applying CS FTL.1.135 (b), (c)

and (d) may not be increased by more than one hour unless the flight crew has been augmented, in which case the maximum flight duty period may be increased by not more than 2 hours;

(3) If on the final sector within a FDP unforeseen circumstances occur after take off that will result in the permitted increase being exceeded, the flight may continue to the planned destination or alternate;

(4) In the event of such circumstances, the rest period following the FDP may be reduced but never below the minimum rest period defined in CS FTL.1.155 (b).

(b) The pilot in command should consult all crew members before deciding these modifications.

#### C. IV. Draft Decision (CS) Part-OR - Subpart OPS - Section VIII

p. 33

comment 80

comment by: Rega / Swiss Air-Ambulance

#### **CS FTL.1 Basic Certification Specification for Commercial Air Transport (Aeroplanes)**

**Ingress:** Swiss Air-Ambulance is operating dedicated ambulance jets solely in the MEDEVAC and repatriation role (see background information at the end of the comment). Commenced ambulance jet MEDEVAC and repatriation operation decades ago with a mixed fleet consisting of Learjet 24/35, BAe-125 Hawker and Canadair CL-600/601 jets, Swiss Air-Ambulance operates now since 2002 a uniformed fleet of 3 dedicated Bombardier CL-604 Challenger ambulance jets fitted with a separated crew rest bunk for 2 pilots in single beds on top of each other.

Due to the specific type of Aeroplane Emergency Medical Service (AEMS) operation it is of utmost importance for Swiss Air-Ambulance to have the ability to conduct when feasible MEDEVAC or repatriation operations as so called "turn around" missions requiring corresponding Flight Duty Periods (FDP).

Reasons:

- Condition of the sick or wounded patient (time)
- Security issues at the destination (no possibility for a night stop for the crew)

Swiss Air-Ambulance has established in close cooperation with its jet pilots as employees, the flight safety department, the chief medical officer and the National Aviation Authority (FOCA) a dedicated "Flight and Duty Time Limitations and Rest Requirements" scheme for non-augmented and augmented flight operation which is for non-augmented crew in accordance with today's "EU-OPS Subpart Q".

After consultation with Mr. Herbert Meyer, EASA Evaluation Board Section Manager Large Aircraft and Mr. Virgilijus Valentukevicius, EASA Rulemaking Officer Ops, Humans Factors and Flight Time Limitations Rulemaking Directorate on the occasion of the EASA conference in Cologne/D on 11.03.2009 as well as with the Swiss NAA FOCA I hereby request to put the today in the Swiss Air-Ambulance Operations Manual A chapter 7 stipulated "Flight and Duty Time Limitations and Rest Requirements" for dedicated ambulance operations in place as alternative to the CS to PART-OR Section VIII "Flight and Duty Time Limitations and Rest Requirements".

The proposed alternative CS to PART-OR Section VIII "Flight and Duty Time Limitations and Rest Requirements" may be titled:

**Text to be added:**

## **CS FTL.2 Basic Certification Specification for dedicated Aeroplane Emergency Medical Service (AEMS) Operations**

### **CS FTL.2.100 Applicability**

CS.FTL.2 constitutes a flight time specification scheme in accordance with OR.OPS.330.FTL and is applicable for dedicated Aeroplane Emergency Medical Service operations (AEMS) in conjunction with the applicable requirements for flight and duty time limitations and rest requirements.

### **CS FTL.2.135 Maximum daily Flight Duty Period**

(a) Maximum daily FDP for a flight crew of 2 pilots without the use of extensions.

Rest of text as per draft text CS FTL.1.135; no change

### **CS FTL.2.136 Maximum daily Flight Duty Period for augmented Crew**

(a) Maximum daily FDP for a flight crew of 3 pilots (augmented crew).

The maximum basic daily FDP shall be 20 hours which shall be reduced by 2 hours for each sector from the fourth sector onwards up to a maximum of 8 sectors.

1 crew bunk must be available for the augmenting/resting flight crew member.

(b) Maximum daily FDP for a flight crew of 4 pilots (augmented crew).

The maximum basic daily FDP shall be 34 hours up to a maximum of 6 sectors.

2 crew bunks must be available for the augmenting/resting flight crew members.

When applying CS FTL.2.136 (a) and (b), extensions of the maximum FDP according CS FTL.1.135 (b) are not allowed.

When applying CS FTL.2.136 (a) and (b) and in addition to the minimum rest period, flight crew members are entitled for additional compensation time specified in the table below.

After missions containing more than one FDP, the claims for compensation time from each FDP will not be cumulative. Instead the FDP resulting in the biggest claim will be taken into account.

The compensation time will follow the rest period resulting at the end of the last FDP of a specific AEMS mission.

Number of Flight Crew Members	FDP in Hours	Compensation Time in Hours	
		Day, Note 1)	Night, Note 2)
2	9 - 13	0	12
	>13	6	18
3 (augmented flight crew)	13 - 15:59	6	18
	16 - 17:59	12	24
	>18	N/A	30
4 (augmented flight crew)	16 - 17:59	12	12
	18 - 23:59	N/A	24
	24 - 28:59		36
	>29		48

Note 1) **Day** No part of the FDP lies between 23:00 and 04:59 local time of the home base

time of the home base

If a mission lasts 3 calendar days or more, the claim for compensation time increases by 24 hours or specified in the table above whichever is higher.

#### **CS FTL.2.140 Flight times and duty periods**

Text as per draft text CS FTL.1.140; no change

#### **CS FTL.2.155 Minimum Rest Period**

Text as per draft text CS FTL.1.155; no change

#### **CS FTL.2.160 Unforeseen circumstances in actual flight operations - discretion by the pilot in command**

Text as per draft text CS FTL.1.160; no change

#### **Proof:**

- Swiss Air Ambulance intends to implement a Fatigue Management Risk System (FMRS) parallel to the implementation of EASA-OPS being part of the Safety Management System (SMS)
- With the introduction of the 3 dedicated Bombardier CL-604 Challenger ambulance jets a group of employed ambulance jet pilots in cooperation with the Flight Operations Manager (FOM) developed the under **CS FTL.2 Basic Certification Specification for dedicated Emergency Medical Service Operations** proposed FDP, rest period and compensation time scheme for Aeroplane Emergency Medical Service (AEMS) operations of Swiss Air-Ambulance. This after in depth analysis of the type of Aeroplane Emergency Mission Service (AEMS) operations Swiss Air-Ambulance conducts.
- The proposed scheme is well accepted not only by the pilots as employees but also by the the chief medical officer, the flight safety officer (FSO), the Accountable Manager (AM), the Flight Operation Manager (FOM) and the Swiss NAA FOCA and published is in the Swiss Air-Ambulance Operations Manual OM A chapter 7. **Find a signed proof of consent of the pilots as employees in Annex 1 of the added files.**
- Swiss Air Ambulance jet pilots conduct their stand-by duty at home with a "notification time" of between one and two hours depending on the type of stand-by duty assigned.
- During a period between April 2008 and March 2009 54% of the stand-by days put at the disposal of Swiss Air Ambulance were used to conduct Aeroplane Emergency Medical Service (AEMS) operations. Thus, the remaining 46% of stand-by days were spent at home on call by the pilots but without duty offering at least partially time for additional rest and recovery.
- Besides technical or training flights, all Swiss Air-Ambulance AEMS and HEMS missions are set up by order of in-house medical doctors and dictated by medical necessity. Swiss Air-Ambulance does neither conduct so called "corporate flights" nor scheduled or unscheduled line flights.
- Swiss Air-Ambulance has its 3 dedicated Bombardier CL-604 Challenger ambulance jets voluntarily and optional fitted with a comprehensive Flight Data Monitoring (FDM) system in compliance to OR.OPS.201 AOC and AMC OR.OPS.201.AOC. This, although the MTOW of the dedicated

Bombardier CL-604 Challenger ambulance jet is well below 27'000kg.

- Swiss Air-Ambulance operates dedicated AEMS ambulance jets since 1973 accumulating during this time period several 10'000 flight hours.
- The Swiss Air-Ambulance Flight Safety Officer (FSO) Jet confirms, that since 1973 no accident or incident was related to fatigue of the flight crew members. **See Annex 2 of the added files.**
- Swiss Air-Ambulance has fitted its 3 dedicated Bombardier CL-604 Challenger ambulance jets with 2 crew bunks in the front part of the aeroplane in lieu of the galley in a single bed configuration with beds on top of each other. The dimensions of each bed are 193cm x 70cm (length x width). The crew bunks are light shaded to the aisle of the aeroplane and noise/temperature insulated to the hull of the aeroplane. The crew bunk area is separated by heavy fabric curtains from the cabin and entry stair area of the aeroplane.
- The galley of the dedicated Bombardier CL-604 Challenger ambulance jets is installed in the aft of the cabin and equipped to serve hot and cold meals to (augmenting) flight crew members.
- The dedicated Bombardier CL-604 Challenger ambulance jets are equipped with a flush toilet and a warm and cold water outlet.

**Background:**

Swiss Air Ambulance is a subsidiary of Rega, Switzerland's national air-rescue organisation, which was founded in 1952. Swiss Air Ambulance can draw on decades of experience and the expertise of professional teams to provide competent, comprehensive assistance in the event of medical emergencies all over the world operating besides 13 dedicated HEMS helicopters 3 dedicated Bombardier CL-604 "Challenger" ambulance jets with a range of 3'500 NM. Its services range from providing medical advice to repatriating patients to/from Switzerland or any other point of the world. Swiss air-ambulance is a private, non-profit organisation, which operates in accordance with the guiding principles of the Red Cross. It comes to the aid of people in distress, without respect of their nationality, religious convections or social status. Swiss air-ambulance operates under the Air Operator Certificate CH-AOC-No.1015 issued by the Federal Office of Civil Aviation Switzerland (FOCA) and is compliant with EU-OPS. ### **Proposed new CS FTL.XXX – Split Duty**

#### **Comment**

The current proposal makes no provisions for split duty periods primarily used by operators to recover an aircraft to base.

#### **Proposal**

##### **Split Duty**

When an FDP consists of two or more sectors but separated by less than a minimum rest period, the FDP may be extended by the amounts indicated below:

Consecutive Hours Rest	Maximum Extension of FDP
Less than 3 hours	Nil
3 – 9.59 hours	A period equal to half the consecutive rest taken

The rest period shall not include the time allowed for immediate post flight duties and pre-flight duties which is a combined minimum total of 30 minutes.

When the rest period is less than 6 hours, adequate facilities must be provided e.g. day room or, a quiet comfortable place which is not open to the public, airport airline activity or other disturbance.

When the rest period is 6 hours or more suitable accommodation must be provided.

As one method to comply with OR.OPS.230.FTL (b)(2) an additional CS for

non-commercial air transport with complex motor-powered aircraft is suggested. It is the current German 2.DV LuftBO, update published April 15th, 2009.

comment 3527 comment by: *FNAM (Fédération Nationale de l'Aviation Marchande)*

**Comment**

All Subpart Q (EU-OPS) must be switched to IRs through the creation of a chapter 4 : "Commercial airplane transport". This include the table, rest requirements and captain discretion. The provisions of article 8.4 regarding rest opportunities should be in CS though.

**Proposal**

We propose the following changes : the creation of a new part that would lead to the following outline: chapter 3: "commercial operators", chapter 4: "aeroplane commercial operators" and so another chapter would be added : chapter 5 "helicopter commercial operators"

**Justification**

This would be the best solution for operators in terms of consistency and flexibility.

comment 3608 comment by: *FNAM (Fédération Nationale de l'Aviation Marchande)*

The Basic Regulation 216/2008 in its article 22 (2.a) states that : "the Agency shall issue the applicable certification specifications to ensure compliance with essential requirements and, as appropriate, the related implementing rules. Initially, the implementing rules shall include all substantive provisions of Subpart Q of Annex III to Regulation (EEC) No 3922/91, taking into account the latest scientific and technical evidence". Moreover European commission letter (05JUN09, DGA/TREN F3/AHA/MS vp D(2009) 55160) states that : "it is a paramount importance to guarantee that the implementing rules to be adopted in this field reproduce the existing relevant legislation (EU-OPS Regulation 3922/91). This will ensure continuity and coherence with such legislation and therefore more certainty for the industry". Our comments are also motivated by the continuity of subpart Q that was acceptable by all european operators. The FNAM proposal is a mix of EASA options 1 and 2. Its objective aims at: the maintain essential requirements of subaprt Q that were accepted by most of european operators; ensuring that legal certainty is kept and let EASA offer the necessary flexibility to adapt the regulation to all types of operations;

comment 3723 comment by: *Bristow Helicopters*

No reference to helicopter operators. Current text provides no reference to aspects of fatigue management that are specific to helicopter operations or typical operating environments. For example, operations in the offshore oil support sector require consideration of issues such as the wearing of survival suits, multiple sectors, inability to leave the cockpit in flight, etc. Additionally, the nature of the industry requires consideration of FTLs relating to Offshore and Remote Site type operations, Emergency/Night flights made by CAT crews. There is also a requirement to consider how FTL should be governed in

operations where pilot are involved in 'mixed' duties, flying both aeroplanes and helicopters. We propose the use of existing UKCAA document CAP371 as the basis for helicopter FTL CS.

FTL.1.135 Maximum daily Flight Duty Period (FDP)**

p. 33-34

comment 6 comment by: *AIR SAFETY GROUP*

1. **CS FTL.1.135 (a) - C hange maximum daily FDP from 13 shown to 12 as per Moebus Scientific Review.**

2. **Using 06. 00 h ours 'best start' time means waking u p an d travelling to work in the WOCL period. The best start time for both tables should be 08.00 hours at the very earliest and even that will probably require getting up at or be fore 06.00 hrs. The other end of both the tables to be 05.30 - 07.59 hrs.**

3. **(b) - Extensions to any FDP and/or reductions of any rest period must never be imposed upon crew members by the operator. It is up to the crew members concerned to decide on any extension by use of Commander's discretion after taking note of the circumstances of all other crew members.** (Note: If a fatigue related incident or accident occurs when an extension of an hour is demanded and imposed by the operator, against the better judgement and wishes of the crew members, who then becomes responsible and liable?)
4. **(c) If Cabin Crew are allowed to extend FDP by up to an hour, then they will need an extra hour's rest and the next FDP for the crew as a whole (Flight and Cabin Crew) will need to be delayed to account for this. Is this the intention?**
5. **CS FTL.1.140 (a) Suggest add in '1 00 duty hours in any 14 consecutive days' and '2000 hours in any 12 consecutive calendar months' in order to comply with the WTD and have all the limitations in one place and readily available for reference.**
6. **(c) - Use of the word 'should' will mean that it may not, indeed probably will not always occur unless that word is changed to MUST and sanctions will be applied to any operator who fails to carry out the intention here.**
7. **CS FTL.1.155 Minimum Rest Period. (b) - Some confusion here as to what is being proposed, as OR OPS.001.FTL PARA 41 (c) quotes minimum rest periods of at least 14 hours to be provided when away from Home Base. What is the intention? Propose an absolute minimum rest away from home base as 12 hours or length of previous duty, whichever is the greater. This may, by Commander's Discretion, be reduced to a minimum of 10 hours rest in the allocated room.**
8. **(c) - There must be a minimum number of Days Off included here of at least 7 in any 28 consecutive days and it is suggested that the average should be at least 8 in any 28 days averaged over 3 x 28 day periods.**
9. **CS FTL.1.160. (a) (2) - there does not appear to be CS FTL.1.135 (d)??**
10. **(a) (3) and (4) provides for an unacceptable open ended FDP, which could prove excessive and lead to fatigue. This may then be followed by an unacceptable reduction in the subsequent rest period. There can always be some justification for extending the FDP to complete the delayed schedule, but there can never be any justification to allow commercial pressure to reduce the subsequent rest period such that inadequate recovery takes place prior to the next FDP. Para (4) should be deleted.**
11. **(b) What happens if the Pilot in command consults with all crew members and opinion as to whether or not some or all members are too fatigued to continue is divided? What if only one cabin crew member is too fatigued to continue? A far better phraseology might be for the Pilot in Command to 'take note of the circumstances of all crew members' before deciding etc.....**

comment 210

comment by: *Eurowings Luftverkehrs AG*Attachment [#30](#)

This sentence does not limit the reduction for more than 5 sectors. In EU-OPS the reduction because of the amount of legs is for "a maximum total of two hours". This definition here does not conform with the table below. Careful reading of the second part of the sentence shows, that the table has only to be taken into account when the WOCL is encroached. Here in the table we find a maximum of reduction for "5 legs or more". This has to be stated in the first part of the sentence as well, like in EU-OPS e.g.: "with a maximum total of 1,5 hours".

The table itself is helpful as current regulations leads to different interpretations and accounting is complicated. The procedures of calculating the average is acceptable. But once again: EASA stated there are no changes to the current regulations. However: the Comparison between the actual maximum FDP and the values of the table give a clear difference for all duties starting in the afternoon. As an example for 4legs the maximum FDP may be up to 1 hour less than actual! There is no reason to do this.

Same applies to sentence (b).

comment by: *Loganair Limited*

No consideration is given for "short hop services" (Usually inter Island) in simple types of Single Pilot Aeroplane. "Short hop services" are usually VFR "lifeline services" in aircraft such as the BN2 with sector lengths from 2 minutes up to 15 minutes. Pilots can currently operate up to 20 or more sectors per day under the provisions of the UK FTL scheme, with adequate provision of a rest break.

Eg An FDP of 10 hours with a 1hr 30 minute rest break, or 9 hours with a 1 hour rest break restricted restricted to 0700 to 2300 local time.

The current proposal would increase manpower costs prohibitively and may need to the loss of these Public Service Obligation lifeline services, which have a proven record of not having a fatigue problem.

Provision is required under this part to allow continuation of these services under existing arrangements.

comment by: *Condor Flugdienst GmbH - FRA HO/R*

According to Condor Flugdienst GmbH, the table is mostly more limiting than the subpart Q calculation. By not interpolating but summarizing values the stepping values tend to jeopardize traceability.

**Suggestion:** Delete the table and replace it. The German Aviation Authority (LBA) recommended a table which fixes the mentioned weaknesses (number of landing and encroaching the WOCL). The wording "This table will simplify rostering process " is not correct.

Compressing step of 30 minutes in the proposed table results in significant differences of max. FDP and causes problems in regards to slot allocation. e.g.: CKI 04:29 = max. FDP of 11:15, but CKI 04:30 = max FDP of 11:45 The WOCL and which deductions are caused by the WOCL are not defined.

comment by: *RAF-AVIA Airlines*

Extended FDP (split duty).

1) FDP consists only of two duties separated by one break, defined and notified

to the crew members in advance. An operator may increase the allowable planned flight duty period prescribed in the Table below:

Consecutive hours break	Increase FDP
0 hrs – 2 hrs 59mins	NIL
3 hrs – 6 hrs 59mins	0.5 length of break
7 hrs – 10hrs 59mins	0.66 length of break

(a) It shall be ensured that the parts of the flight duty period before and after the break do not exceed 10 hours, and the total flight duty period, as increased in accordance with the table above, does not exceed 20 hours.

(b) The split duty time is not allowed to be combined with using extended flight crew or allowed extended flight duty time.

(c) If the break is 6 hours or more or covers 3 hours or more within the period from 22.00 to 06.00 local time in the place where it occurs, suitable accommodation shall be provided.

(d) If suitable accommodation is provided, the duration of break needs to be included in the rest period calculation.

(e) A flight duty period can be split by a break, which is at least 4 hours long and starts not earlier than 30 min. after the engines are shut down and finishes not later than 45 min. before start of the flight, in case flight duty time prolongation has not been planned in advance.

2) The Authority may grant approval to an operation based on an extended FDP including a break, subject to the provisions of Article 8.

3) Each operator will have to demonstrate to the Authority, using operational experience and taking into account other relevant factors, such as current scientific knowledge, that its request for an extended FDP produces an equivalent level of safety.

1115

comment by: AEA

**Comment:**

The table does not correspond to the text of CS.FTL.1.135 and it does not correspond to EU-OPS since it is more restrictive than the text of Subpart Q. This is completely unacceptable to AEA since it would have significant cost impact (up to 40 minutes reduction in the max FDP) for no safety justification. When computing the table there is a need to first compute the effect of the number of sectors before applying the WOCL

**Proposal:**

Delete the table.  
Realign with EU-OPS Subpart Q.

comment

1116

comment by: AEA

**Relevant Text:**

c) FDP with different reporting time for flight crew and cabin crew

In cases where cabin crew require more time than the flight crew for their pre-flight briefing for the same flight or series of flights, the FDP of the cabin crew may be extended by the difference in reporting time between the cabin crew and the flight crew, as long as the difference does not exceed 60 minutes

**Comment:**

The wording is different from EU-OPS (reference to the same flight is more restrictive than EU-OPS). In order to avoid any misunderstanding the AEA suggest sticking to the EU-OPS wording.

**Proposal:**

For cabin crew being assigned to a flight or series of flights, the FDP of the cabin crew may be extended by the difference in reporting time between cabin crew and flight crew, as long as the difference does not exceed one hour.

comment by: ECA - European Cockpit Association

Comment on CS FTL.1.135(a):

Maximum daily FDP without the use of extensions.

The maximum basic daily FDP shall be 13 hours which shall be reduced by 30 minutes for each sector from the ~~third~~ **second** sector onwards and be further reduced (up to a maximum of two hours) when the WOCL is encroached in accordance with the limits specified in the table below:

Justification:

Latest scientific knowledge must be observed when limiting the max. daily duty and flight duty period. We do not see this in CS FTL.1.135. Especially we request to introduce the concept of acclimatization when limiting the daily FDP.

The provisions (Table) for the maximum basic FDP of up to 13 hours are not in keeping with the body of scientific evidence and shall be amended to meet the following requirements:

13-hour FDPs are only acceptable under specific conditions.

The FDP for minimum crew should not exceed 10 hours overnight.

The maximum FDP shall be reduced by 30 minutes per sector for every sector after the first.

The maximum FDP should be reduced for non-acclimatized crew.

CS FTL.1.135 states a reduction "...up to a maximum of two hours" which is not correctly represented in the table. Formally correct "5 sectors +" should have been "5 sectors" and "6 sectors +" should have been added. However, since the scientific evaluation supports a deduction from the second sector onwards the table's schematic may stay as it is, just the limits should be changed.

Note: The tables as given under (a) and (b) do not provide a full 2 hour deduction due to the number of sectors as a column for 6 sectors is missing. However, since the deduction for sectors shall be applied from the second sector onwards an additional column is not required.

comment 1155 comment by: *ECA - European Cockpit Association*

Comment on CS FTL.1.135(b):

This paragraph should be deleted in accordance with the Moebus Aviation Study. See answer of the scientific evaluation below.

Justification:

Scientific evaluation Question 3

The use of rostered extensions including the mitigation measures (ref EU OPS 1.1105 para 2) should be deleted.

comment 1156 comment by: *ECA - European Cockpit Association*

Comment on CS FTL.1.135:

EASA should draft appropriate rules on split duties in line with the Moebus Scientific evaluation, which has the following recommendation for scheduling "split duty":

1. The break between the two sub-duties should be at least one third of the length of the total flight duty period;
2. Adequate sleeping facilities must be provided by the operator if the break does not take place where the crew lives;
3. The total flight duty period of a split duty should never start before 06:00 or end after 22:00;
4. In the case of consecutive split duties, the total FDP of a split duty should never be extended beyond 14 hours in order to allow an absolute minimum of 10 hours daily rest;
5. Consecutive split duties with reduced daily rest time must be accompanied by an FRMS that includes training of crews and a reporting system. Our response is limited to split duties that extend the FDP beyond 12 hours. For split duties that do not extend the FDP, we have assumed that Ops 1.1095 paragraph 1.3 applies to the break between the two sub-duties.

comment 1157 comment by: *ECA - European Cockpit Association*

Comment on CS FTL.1.135: Add paragraph to give provision for augmented crew operation.

Justification:

Augmented Crew Operation has been left out, but it is related to how to extend the maximum FDP as described in CS FTL.1.135 (a), (b) and (c).

The guidelines for the application of augmented crew operation shall follow strictly the findings as lined out in the TNO- Report (TNO-V 2007C363)

comment

1159

comment by: ECA - European Cockpit Association

Comment on CS FTL.1.135:  
Add new paragraph to introduce provision for mixed duties as follows:

**Relations between flight duty period and duty period**

**When a crew member is required to report for duty in advance of the stipulated report time for a scheduled flight to carry out a task at the behest of the company, then the time spent on that task shall be part of the subsequent FDP. The FDP limit shall be calculated on the base of the earlier reporting time.**

Justification:

This is to ensure that crew members are not fatigued when starting a FDP directly after activities like simulator or administrative tasks.

comment

1162

comment by: ECA - European Cockpit Association

Comment on CS FTL.1.135(c):

Moebus Study:

Cabin crew members are more fatigued and therefore the same duty and rest requirements should be applied for both flight crew and cabin crew. It is recommended that an extension of the FDP of cabin crew with 30 minutes (to cater for the pre-flight briefing of cabin crew), would necessitate an adjustment of the rest period for cabin crew.

comment by: Sven Freisenich

Attachments [#31](#) [#32](#) [#33](#)

FDP (a)

It is not possible to verify the values and the logic of the table, because the original rules are not part of the text. For example: Is the 50% WOCL-correction taken into account?

The table is in general more restrictive than EU-OPS subpart Q, sometimes EASA allows a longer FDP:

- the actual FDP is not used to calculate the maximum allowable FDP;
- the sector correction is applied after the WOCL correction;
- the 50% correction when encroaching the WOCL is not always applied correctly;

by using time brackets for reporting on duty times the max. FDP has in some instances been reduced.

The safety arguments for the following adjustments are lacking:

The sector correction is reduced from maximum daily FDP after the WOCL-correction (the values in columns 3, 4 and 5 is not correct and contradictory with the EU-OPS 1.135 (a));

When calculating the WOCL-correction, a sliding scale is used. This is not taken into account when using brackets of 30 minutes;

When you calculate a FDP of 11.55 starting at 16.15, this gives  $16.15 + 11.55 = 28.10 = 04.10$ . This gives 2.10 in WOCL so max FDP  $13.00 - (130/2) = 11.55$

The max FDP for a start at 16.15 for 2 sectors is 11.55 i.s.o. 11.25 in table.

When the FDP ends in the WOCL, there is an optimization of calculation required:

Start at 17:15 and 5 sectors gives 10:35 max FDP, so end at 03:50

$13:00 - 01:30$  (3 sectors) –  $00:55$  (  $1:50$  in WOCL /2) = 10:35

Table in NPA gives 09:30 (=wrong way of calculating)

A step of 30 minutes will result in significant differences in calculated FDP causing problems with availability of airport slots.

LTU proposes to delete the 30-min table and replace it by a 5-min step table based on EU-OPS1.1105.

### **CS FTL.1.135 Maximum daily Flight Duty Period (FDP)**

(a) Maximum daily FDP without the use of extensions

The maximum basic daily FDP shall be 13 hours which shall be reduced by 30 minutes for each sector from the third sector onwards and be further reduced (up to a maximum of two hours) when the WOCL is encroached. The calculated Basic FDP is specified in **Table A**. The start of FDP is expressed in the WOCL time zone as per OR.OPS.010.FTL(o).

Table A has been calculated in accordance and in the sequence of EU-OPS as shown in attached **Flowchart**.

The calculation method to ensure that the Maximum FDP is reduced by 50% of the calculated Basic FDP is explained in attached **Memo**.

The differences between Table A and EASA CS FTL.135(a) are shown in attached **Graph A**.

FDP (b)

Following the sequence of the rules, the WOCL has been taken into account at the beginning. Therefore, extensions are not influenced anymore by the WOCL. Per EU-OPS, the maximum daily FDP can be extended by up to one hour per EU-OPS1.1105.1.

### **CS FTL.1.135 Maximum daily Flight Duty Period (FDP)**

(b) Maximum daily FDP with the use of extensions.

The maximum daily FDP can be extended by up to one hour and this extension is limited to a maximum of 5 sectors. The extension is further limited to a maximum of four sectors when the WOCL is encroached and to a maximum of two sectors when FDP encroaches the WOCL by more than two hours. The calculated Extended FDP are specified in **Table B**. The start of FDP is expressed in the WOCL time zone as per OR.OPS.010.FTL(o). Flights departing between 22:00 and 05:00 are limited to 11:45.

The maximum number of times that extensions can be used is two in any seven consecutive days. Where an FDP is planned to use an extension, the minimum pre flight and post flight rest periods are increased by two hours, or post flight rest only is increased by four hours. Where the extensions are used for consecutive FDPs the pre and post rest between the two operations run consecutively.

Table B has been calculated in accordance and in the sequence of EU-OPS as shown in attached **Flowchart**. The one hour extension is only added when permitted by the WOCL encroachment of the Basic FDP for the number of sectors.

The differences between Table B and EASA CS FTL.135(a) are shown in attached **Graph B**.

FDP (c)

The added word 'same' makes this article more restrictive. The safety argument for this adjustment is lacking.

Delete the word "same" and add:

"(d) For the determination of the maximum FDP of the cabin crew the reporting time of the flight crew shall be assumed to be the reporting time of the cabin crew."

### **CS FTL.1.135 Maximum daily Flight Duty Period (FDP)**

(c) FDP with different reporting time for flight crew and cabin crew in cases where cabin crew require more time than the flight crew for their pre-flight briefing for the flight or series of flights, the FDP of the cabin crew may be extended by the difference in reporting time between the cabin crew and the flight crew, as long as the difference does not exceed 60 minutes.

(d) For the determination of the maximum FDP of the cabin crew the reporting time of the flight crew shall be assumed to be the reporting time of the cabin crew.

Motivation: Cabin crew shall never be the limiting factor with respect to FDP.

If the reporting time of the cabin crew is used to determine the maximum FDP, it could be that in certain instances the cabin crew will still be more restrictive by as much as one hour w.r.t. the flight crew.

Eg.: Cc. reports at 04:00; Fc. reports at 05:00. Cc. max FDP will be 11:15 + 01:00 = 12:15 i.e. latest reporting off time 16:15; Fc max FDP will be 12:15 i.e. latest reporting off time 17:15.

comment by: *British Airways*

The start time of the FDP in the tables – does this refer to Local Time?

The 24 hour period is split into too many incremental stages making the table overly complicated. When using the table there is a need to first compute the effect of the number of sectors before applying the WOCL.

We do support the principle that two sector operations have the same FDP limit as a single sector.

Currently CAP 371 permits that Cabin Crew are allowed an additional hour to their FDP limit compared to Flight Crew. This removes the requirements set out in item (c).

The FDP limits for Cabin Crew between 1800-0559 are more restrictive than our current Scheme and would impact our in-flight rest requirements on services departing during this period. There isn't any safety justification for Cabin Crew in making this more constrained.

Additionally Cabin Crew can extend their allowable FDP if they meet the following conditions:

14:00 shall be substituted for the figure derived from BA Scheme table C when the following conditions are met:

The duty is a single sector operation, and a day off (minimum of 34 hours) is planned immediately prior to and after the FDP, and on return to base at least 3 consecutive days off are given, and the local reporting time is between 18:00 and 05:59, and on board rest provisions are provided.

Info is missing on how to extend the FDP by use of a) Augmented Crews & b) Split Duties.

**Comment:**

The table does not correspond to the text of CS.FTL.1.135 and it does not correspond to EU-OPS since it is more restrictive than the text of Subpart Q. This is completely unacceptable to AEA since it would have significant cost impact (up to 40 minutes reduction in the max FDP) for no safety justification. When computing the table there is a need to first compute the effect of the number of sectors before applying the WOCL

**Proposal:**

Delete the table.

Realign with EU-OPS Subpart Q.

**CS FTL.1.135 Maximum daily Flight Duty Period (FDP)**

(a) Maximum daily FDP without the use of extensions.

The maximum basic daily FDP shall be 13 hours which shall be reduced by 30 minutes for each sector from the third sector onwards and be further reduced (up to a maximum of two hours) when the WOCL is encroached in accordance with the limits specified in the table below:

**CFDT France & ET F Comment: The provisions on maximum daily FDP should be reflected in IR.**

Reason: Maximum daily FDP is to be considered a substantive provision of Subpart Q EU OPS (BR 216/2008 Art 22, 2. (a).

~~(b) Maximum daily FDP with the use of extensions:~~

~~The maximum daily FDP can be extended by up to one hour and this extension is limited to a maximum of 5 sectors. The extension is further reduced to a maximum of four sectors when the WOCL is encroached and to a maximum of two sectors when FDP encroaches the WOCL by more than two hours with the limits specified in table below:~~

~~...~~

~~The maximum number of times that extensions can be used is two in any seven consecutive days. Where an FDP is planned to use an extension, the minimum pre flight and post flight rest periods are increased by two hours, or post flight rest only is increased by four hours. Where the extensions are used for consecutive FDPs the pre and post rest between the two operations run consecutively.~~

**Comment:** Delete point (b) **As the CFDT remarked in OP OPS 335 FTL FDP the 13 hour Maximum Daily FDP should be reduced after the FIRST sector ..**

Reason: Taking into account latest scientific evidence, the MOEBUS study

recommends reducing the maximum basic FDP after the first sector and furthermore establishes the need for more scientific evaluation of any FDP that includes more than 4 sectors. Regarding FDP that include the WOCL, these should, according to the results of the MOEBUS study, never exceed 10 hours.

**Comment:** The provisions on maximum daily FDP should be reflected in IR. FTL tables should be amended accordingly.

**Reason:** The proposed IR should take latest scientific and technical evidence into account (BR 216/2008 Art. 22, 2. (a)); the MOEBUS study, in its answers to questions 2 and 3 quotes numerous scientific studies to substantiate their recommendation to remove the provision for extensions to maximum daily FDP unless flight and cabin crew are augmented and in-flight breaks and the corresponding adequate rest facilities on board are defined in CS (see answers to questions 12 and 13 MOEBUS study).

(c) FDP with different reporting time for flight crew and cabin crew

~~In cases where cabin crew require more time than the flight crew for their pre-flight briefing for the same flight or series of flights, the FDP of the cabin crew may be extended by the difference in reporting time between the cabin crew and the flight crew, as long as the difference does not exceed 60 minutes.~~

**Replace:** In the cases, defined in the applicable flight time specification scheme and appropriate for the type of operation, where cabin crew require more time than the flight crew for their pre-flight briefing for the same flight or series of flights, the FDP of the cabin crew may be extended by the difference in reporting time between the cabin crew and the flight crew, as long as the difference does not exceed 30 minutes and the reporting time for flight crew and cabin crew fall in the same circadian time category.

**Reason:** In order to take into account latest scientific and technical evidence (see answer to question 5 of the MOEBUS study) operators should develop more efficient briefing techniques; when approving a flight time specification scheme proposing different reporting times for flight and cabin crew the Agency should pay special attention to the fact that this extension of the maximum FDP can only be used where strictly safety related duties make this necessary.

comment by: *Airlec Air Espace / Paul Tiba*Attachment [#34](#)

We are an air ambulance specialist and every mission has an average flight duty period (FDP) of 15-16h. I think that the text should include an exception for urgent medical flights (like it was in the Eu-OPS). Otherwise, it will become impossible to make ambulance flights for European companies. For that, I propose you to take the French law that was written to implement the Eu-OPS here. What is very important to note is that we have now a successful experience of two seasons with this text in France. Please find the attached law. Please also find below the key facts –for urgent medical flight, in the case of bi-pilots crews and for companies that have a Safety Management System for every Risk linked to the Fatigue–.

- The maximum FDP is 18h which shall be reduced by 30 minutes for each sector from the fourth one (up to a maximum of two hours).
- This maximum shall be increased by 1h once a week (without over passing the maximum of 18h and for flights including no more than five sectors).
- In the case of unforeseen circumstances, the maximum FDP may be increased by 2 hours at discretion of the PIC.
- When the flight starts within the Window Of Circadian Low (WOCL), the maximum FDP shall be reduced by 100% of this period (up to a maximum of two hours).
- When the flight ends within the Window Of Circadian Low (WOCL), the maximum FDP shall be reduced by 50% of this period.
- Rest period (RP): on base = Max (12h; Duty Period –DP–); out of base = Max (10h; DP) with at least 8h to sleep.
- Reduced RP:

Insufficiency = normal rest period – real reduced rest period.

If previous or next FDP > 14h, reduced RP = 10h. Next FDP has a maximum of 4 sectors. Next normal rest period is not less than 24h with 1 local night. The

maximum next FDP should be reduced by the insufficiency. However, it is possible not to reduce it adding the insufficiency to the next normal RP. If previous and next FDP < 14h, reduced RP = 7h30. Next FDP has a maximum of 4 sectors.

No more than 2 reduced RP should be used between two programmed RP.

- Programmed RP: 36h with two local nights + normal RP following the latest flight. Two consecutive programmed RP shall not be separated by more than 168h.

Many thanks in advance.

### **CS FTL 1.135 Maximum Daily Flight Duty Period**

#### **Comment:**

Current CAP 371 FDP tables have evolved over decades of flying experience. We therefore believe that CAP 371 constitutes a comparable level of safety to CS FTL 1.135 and as a result should be an acceptable means of compliance. Variations to maximum Flying Duty Period of 14 hours should be allowed providing there are compensating factors taking into account previous operational experience of these operations. The additional report time of Cabin Crew should be taken into account to ensure that Cabin crew are not the limiting factor.

#### **Proposal:**

**Add UK CAP 371 as an AMC + the variations noted above.**

comment by: *Swiss International Airlines / Bruno Pfister***Comment:**

The table does not correspond to the text of CS.FTL.1.135 and it does not correspond to EU-OPS since it is more restrictive than the text of Subpart Q. This is completely unacceptable to AEA since it would have significant cost impact (up to 40 minutes reduction in the max FDP) for no safety justification. When computing the table there is a need to first compute the effect of the number of sectors before applying the WOCL

**Proposal:**

Delete the table.  
Realign with EU-OPS Subpart Q.

comment

2976

comment by: *Swiss International Airlines / Bruno Pfister***Relevant Text:**

c) FDP with different reporting time for flight crew and cabin crew

In cases where cabin crew require more time than the flight crew for their pre-flight briefing for the same flight or series of flights, the FDP of the cabin crew may be extended by the difference in reporting time between the cabin crew and the flight crew, as long as the difference does not exceed 60 minutes

**Comment:**

The wording is different from EU-OPS (reference to the same flight is more restrictive than EU-OPS). In order to avoid any misunderstanding the AEA suggest sticking to the EU-OPS wording.

**Proposal:**

For cabin crew being assigned to a flight or series of flights, the FDP of the cabin crew may be extended by the difference in reporting time between cabin crew and flight crew, as long as the difference does not exceed one hour.

comment by: *UCC SLO*

(a) Maximum daily FDP without the use of extensions.

The maximum basic daily FDP shall be 13 hours which shall be reduced by 30 minutes for each sector from the third sector onwards and be further reduced (up to a maximum of two hours) when the WOCL is encroached in accordance with the limits specified in the table below:

**Comment:** The provisions on maximum daily FDP should be reflected in IR.

**Reason:** Maximum daily FDP is to be considered a substantive provision of Subpart Q EU OPS (BR 216/2008 Art 22, 2. (a)).

~~(b) Maximum daily FDP with the use of extensions.~~

~~The maximum daily FDP can be extended by up to one hour and this extension is limited to a maximum of 5 sectors. The extension is further reduced to a maximum of four sectors when the WOCL is encroached and to a maximum of two sectors when FDP encroaches the WOCL by more than two hours with the limits specified in table below:~~

~~==~~

~~The maximum number of times that extensions can be used is two in any seven consecutive days. Where an FDP is planned to use an extension, the minimum pre-flight and post-flight rest periods are increased by two hours, or post-flight rest only is increased by four hours. Where the extensions are used for consecutive FDPs the pre and post rest between the two operations run consecutively.~~

**Comment:** Delete point (b)

**Reason:** The proposed IR should take latest scientific and technical evidence into account (BR 216/2008 Art. 22, 2. (a)); the MOEBUS study, in its answers to questions 2 and 3 quotes numerous scientific studies to substantiate their recommendation to remove the provision for extensions to maximum daily FDP unless flight and cabin crew are augmented and in-flight breaks and the corresponding adequate rest facilities on board are defined in CS (see answers to questions 12 and 13 MOEBUS study).

(c) FDP with different reporting time for flight crew and cabin crew

~~In cases where cabin crew require more time than the flight crew for their pre-flight briefing for the same flight or series of flights, the FDP of the cabin crew may be extended by the difference in reporting time between the cabin crew and the flight crew, as long as the difference does not exceed 60 minutes.~~

Replace: In the cases, defined in the applicable flight time specification scheme and appropriate for the type of operation, where cabin crew require more time than the flight crew for their pre-flight briefing for the same flight or series of flights, the FDP of the cabin crew may be extended by the difference in reporting time between the cabin crew and the flight crew, as long as the difference does not exceed 30 minutes and the reporting time for flight crew and cabin crew fall in the same circadian time category.

**Reason:** In order to take into account latest scientific and technical evidence (see answer to question 5 of the MOEBUS study) operators should develop more efficient briefing techniques; when approving a flight time specification scheme proposing different reporting times for flight and cabin crew the Agency should pay special attention to the fact that this extension of the maximum FDP can only be used where strictly safety related duties make this necessary.

comment by: *BALPA*

We support the use of tables for ease of use by all parties. However, can you please clarify the following:

In Subpart Q it states "When the FDP starts in the WOCL, the.. (allowable FDP).. will be reduced by 100 % of its encroachment up to a maximum of two hours. When the FDP ends in or fully encompasses the WOCL, the.. (allowable FDP).. will be reduced by 50 % of its encroachment". We're unsure if the table has this intent. For example, I report at 0530 for a 2-sector flight. FDP = 13 hours but reduced by 29 minutes means I have a maximum FDP of 12:31; from the table below I can do 12:45 – which one is right?

Again, we support your stance that the use of current scientific knowledge is to be used throughout the forthcoming document. This section needs to be reviewed using this knowledge and we urge you to address this area as a matter of importance.

We are concerned that there is no distinction made between acclimatised and non-acclimatised crewmembers FDP's, and any consideration to the number of timezones crossed, within these tables. Are you planning to address this?

comment by: *Lufthansa CityLine GmbH*

In general reductions applying OPS 1.1105, 1.4 and 1.5 by steps of 30 minutes might be helpful.

But the calculations in CS FTL.1.135 (a) and (b) are not understandable and it is not acceptable that even FDPs not encroaching on the WOCL should be reduced below the limits of Subpart Q.

Example: FDP with 4 sectors, start at 13:59 It

Max. FDP

- according **OPS 1.1105, 1.3, 1.4 and 1.5:**  
**12 hrs**, latest ending **01:59 It**

- according **CS FTL.1.135 (a) :**  
**11.40 hrs**, latest ending **01:39 It**

comment

comment by: DGAC

Attachment [#35](#)

a) use of tables

It is agreed that the EUOPS rules for the FDP calculation should be illustrated. The problem of a table is that it is not exact and the result can be slightly different from the regulation. A linear graph is more accurate and would be easier to use on the field. Besides, changing again all the values will cost to operators who already have settled the software rules or manual procedures to be compliant with EU-OPS data.

(see attachment comm 3182.jpg)

b) maximum FDP calculations without extensions

The calculation method is explained at the beginning of the (a) of CS FTL.1.135. It is explained that the basic daily FDP (13h) reduced :

- 1) according to the number of sectors (OPS 1.1105 §1.4)
- 2) and be further reduced depending on the impact in the WOCL.

It corresponds to the definition of the WOCL calculation described in OPS 1.1105 §1.5 :

*OPS 1.1105*

**Maximum daily flight duty period (FDP)**

*1.5. When the FDP starts in the WOCL, **the maximum stated in point 1.3 and point 1.4 will be reduced** by 100 % of its encroachment up to a maximum of two hours. When the FDP ends in or fully encompasses the WOCL, the maximum FDP stated in point 1.3 and point 1.4 will be reduced by 50 % of its encroachment.*

The table though is not calculated this way but the opposite way: it takes into account firstly the impact in the WOCL and then the number of sectors. It is clear as the maximum FDP for 1 or 2 sector (so without the reduction for sectors) is correct and the mistake is to start from this value to deduce those for 3 sectors and more.

**Example:**

Calculation with EU OPS rules: **4 sectors, Start of FDP at 16h10.**

- 1) 4 sectors : reduction of the maximum basic FDP (13h) of 1 hour ie 12h
- 2) WOCL: 16h10+12h => maximal arrival at 4h10 => impact 2h10  
reduction 1h05 => maximum FDP 12h-1h05 = 10h55

Calculation of IR OPS

1bis) WOCL : 16h10+ 13h => 5h10 => WOCL impact 3h10 => reduction of 1h35 min => FDP 13h-1h35=11h25

2 bis) 4 sectors : reduction of 1 hour => maximum FDP 11h25-1h=**10h25**

**There is a 30 min time difference between the FDP max IR-OPS and the**

**FDP max EU-OPS**

c) 5 sectors or more

OPS 1.1105 1.4. *These 13 hours will be reduced by 30 minutes for each sector from the third sector onwards with a maximum total reduction of two hours.*

The maximum reduction of the FDP with the numbers of sectors is 2 hours, which corresponds to 6 sectors. For 5 sectors the reduction will be 1h30. As there is a difference of 30 minutes there is no reason to assimilate 5 sectors and 6 sectors. There should be another column with "6 sectors or more".

~~...~~

~~The maximum number of times that extensions can be used is two in any seven consecutive days. Where an FDP is planned to use an extension, the minimum pre-flight and post-flight rest periods are increased by two hours, or post-flight rest only is increased by four hours. Where the extensions are used~~

~~for consecutive FDPs the pre and post rest between the two operations run consecutively.~~

**Comment: Delete point (b)**

**Reason:** The proposed IR should take into account the latest scientific and technical evidence into account (BR 216/2008 Art. 22, 2. (a)); the MOEBUS study, in its answers to questions 2 and 3 quotes numerous scientific studies to substantiate their recommendation to remove the provision for extensions to maximum daily FDP unless flight and cabin crew are augmented and in-flight breaks and the corresponding adequate rest facilities on board are defined in CS (see answers to questions 12 and 13 MOEBUS study).

(c) FDP with different reporting time for flight crew and cabin crew  
~~In cases where cabin crew require more time than the flight crew for their pre-flight briefing for the same flight or series of flights, the FDP of the cabin crew may be extended by the difference in reporting time between the cabin crew and the flight crew, as long as the difference does not exceed 60 minutes.~~

**Replace:** In the cases, defined in the applicable flight time specification scheme and appropriate for the type of operation, where cabin crew require more time than the flight crew for their pre-flight briefing for the same flight or series of flights, the FDP of the cabin crew may be extended by the difference in reporting time between the cabin crew and the flight crew, as long as the difference does not exceed 30 minutes and the reporting time for flight crew and cabin crew fall in the same circadian time category.

**Reason:** In order to take into account the latest scientific and technical evidence (see answer to question 5 of the MOEBUS study) operators should develop more efficient briefing techniques; when approving a flight time specification scheme proposing different reporting times for flight and cabin crew the Agency should pay special attention to the fact that this extension of the maximum FDP can only be used where strictly safety related duties make this necessary.

**CS FTL.1.140 Flight times and duty periods**

~~(a) The total duty periods to which a crew member is assigned shall not exceed:~~

- ~~(1) 60 duty hours in any seven consecutive days;~~
- ~~(2) 190 duty hours in any 28 consecutive days.~~

**Replace:** (a) The total duty periods to which a crew member is assigned shall not exceed:

- (1) 60 duty hours in any seven consecutive days;**
- (2) 180 duty hours in any 28 consecutive days.**
- (3) 100 duty hours in any 14 consecutive days.**

**Reason:** See reason for proposed change to OR.OPS.040.FTL. An additional limit of 100 duty hours in any 14 consecutive days should be introduced in the CS guarantee that duty is spread out as evenly as possible. (See answer to question 1 MOEBUS study).

**(b) The total flight time of the flights on which an individual crew member is assigned as an operating crew member shall not exceed:**

- (1) 100 flight hours in any 28 consecutive days;**
- (2) 900 flight hours in any 12 consecutive calendar months.**

**Comment:** The limits reflected in (b) should be reflected in IR; they are to be considered substantive provisions of Subpart Q E U OPS and BR 216/2008 Art. 22, 2. (a) and should therefore be included in IR.

(c) The total duty periods and total flight times referred to in (a) and (b) above

should be spread as evenly as practicable throughout their respective periods.

**Replace:** "possible"

**Reason:** The word practicable leads to the conclusion that this only should be done where no additional cost is generated. The present OPS is intended to avoid cumulative fatigue and increase flight safety. Operators should be encouraged to do everything possible within their operational limits to comply with this.

comment

3923

comment by: *Air Berlin PLC & Co. Luftverkehrs KG*

It is not possible to verify the values and the logic of the table, because the original rules are not part of the text. For example: Is the 50% WOCL-correction taken into account?

The table is in general more restrictive than EU-OPS subpart Q, sometimes EASA allows a longer FDP:

- the actual FDP is not used to calculate the maximum allowable FDP;
- the sector correction is applied after the WOCL correction;
- the 50% correction when encroaching the WOCL is not always applied correctly;
- by using time brackets for reporting on duty times the max. FDP has in some instances been reduced.

The safety arguments for the following adjustments are lacking:

The sector correction is reduced from maximum daily FDP after the WOCL-correction (the values in columns 3, 4 and 5 is not correct and contradictory with the EU-OPS 1.135 (a));

When calculating the WOCL-correction, a sliding scale is used. This is not taken into account when using brackets of 30 minutes;

When you calculate a FDP of 11.55 starting at 16.15, this gives

$16.15 + 11.55 = 28.10 = 04.10$ . This gives 2.10 in WOCL so max FDP  $13.00 - (130/2) = 11.55$   
 The max FDP for a start at 16.15 for 2 sectors is 11.55 i.s.o. 11.25 in table.

When the FDP ends in the WOCL, there is an optimization of calculation required:

Start at 17:15 and 5 sectors gives 10:35 max FDP, so end at 03:50

$13:00 - 01:30$  (3 sectors) –  $00:55$  ( 1:50 in WOCL /2) = 10:35

Table in NPA gives 09:30 (=wrong way of calculating)

A step of 30 minutes will result in significant differences in calculated FDP causing problems with availability of airport slots.

Air Berlin proposes to delete the 30-min table and replace it by a 5-min step table based on EU-OPS1.1105.

### **CS FTL.1.135 Maximum daily Flight Duty Period (FDP)**

(a) Maximum daily FDP without the use of extensions

The maximum basic daily FDP shall be 13 hours which shall be reduced by 30 minutes for each sector from the third sector onwards and be further reduced (up to a maximum of two hours) when the WOCL is encroached. The calculated Basic FDP is specified in **Table A**. The start of FDP is expressed in the WOCL time zone as per OR.OPS.010.FTL(o).

Table A has been calculated in accordance and in the sequence of EU-OPS as shown in attached **Flowchart**. The calculation method to ensure that the Maximum FDP is reduced by 50% of the calculated Basic FDP is explained in attached **Memo**. The differences between Table A and EASA CS FTL.135(a) are shown in attached **Graph A**.

Following the sequence of the rules, the WOCL has been taken into account at the beginning. Therefore, extensions are not influenced anymore by the WOCL. Per EU-OPS, the maximum daily FDP can be extended by up to one hour per EU-OPS1.1105.1.

### **CS FTL.1.135 Maximum daily Flight Duty Period (FDP)**

(b) Maximum daily FDP with the use of extensions.

The maximum daily FDP can be extended by up to one hour and this extension is limited to a maximum of 5 sectors. The extension is further limited to a maximum of four sectors when the WOCL is encroached and to a maximum of two sectors when FDP encroaches the WOCL by more than two hours. The calculated Extended FDP are specified in **Table B**. The start of FDP is expressed in the WOCL time zone as per OR.OPS.010.FTL(o). Flights departing between 22:00 and 05:00 are limited to 11:45.

The maximum number of times that extensions can be used is two in any seven consecutive days. Where an FDP is planned to use an extension, the minimum pre flight and post flight rest periods are increased by two hours, or post flight rest only is increased by four hours. Where the extensions are used for consecutive FDPs the pre and post rest between the two operations run consecutively.

Table B has been calculated in accordance and in the sequence of EU-OPS as shown in attached **Flowchart**. The one hour extension is only added when permitted by the WOCL encroachment of the Basic FDP for the number of sectors.

The differences between Table B and EASA CS FTL.135(a) are shown in attached **Graph B**.

The added word 'same' makes this article more restrictive. The safety argument for this adjustment is lacking.

Delete the word "same" and add:

"(d) For the determination of the maximum FDP of the cabin crew the reporting time of the flight crew shall be assumed to be the reporting time of the cabin crew."

### **CS FTL.1.135 Maximum daily Flight Duty Period (FDP)**

(c) FDP with different reporting time for flight crew and cabin crew in cases where cabin crew require more time than the flight crew for their pre-flight briefing for the flight or series of flights, the FDP of the cabin crew may be extended by the difference in reporting time between the cabin crew and the flight crew, as long as the difference does not exceed 60 minutes.

(d) For the determination of the maximum FDP of the cabin crew the reporting time of the flight crew shall be assumed to be the reporting time of the cabin crew.

Motivation: Cabin crew shall never be the limiting factor with respect to FDP.

If the reporting time of the cabin crew is used to determine the maximum FDP, it could be that in certain instances the cabin crew will still be more restrictive by as much as one hour w.r.t. the flight crew.

Eg.: Cc. reports at 04:00; Fc. reports at 05:00. Cc. max FDP will be 11:15 + 01:00 = 12:15 i.e. latest reporting off time 16:15; Fc max FDP will be 12:15 i.e. latest reporting off time 17:15.

comment by: ANE (Air Nostrum) OPS QM

CS FTL 1.135. Maximum daily flight duty period

The new flight time limitations ( without considering FDP extensions) , reduce considerably the EU-OPS maximum flight time limits ( we find days periods when the difference is up to 2 hours form EU-OPS limitations).

It is hard to evaluate the impact of this new table because it is not possible to know accurately the differences with current Flight Duty Period Limits (because

of WOCL). However it is easy to see that in some cases new limits are quite more restrictive compared with SUBPART Q limits. If this new table is decided, either it would be a lot of crew going beyond these new limits due to common daily operation delays, or in order to avoid those delays it would be needed to hire more crews. Indeed, it seems it is a table too big in order to add into our current information systems.

Recent EASA presentations regarding options for future FTL scheme for CAT operations [RM task OPS 055] means this section remains under review. A lack of response at this time should not be interpreted as tacit acceptance of Section VIII. We reserves the right to come back to EASA on Section VIII once the options issue has been settled. We understand that the Agency are planning separate Rule making activity in regard to FTL and wish to re-iterate that we would welcome Industry participation.

(c) FDP with different reporting time for flight crew and cabin crew  
~~In cases where cabin crew require more time than the flight crew for their pre-flight briefing for the same flight or series of flights, the FDP of the cabin crew may be extended by the difference in reporting time between the cabin crew and the flight crew, as long as the difference does not exceed 60 minutes.~~

Replace: In the cases, defined in the applicable flight time specification scheme and appropriate for the type of operation, where cabin crew require more time than the flight crew for their pre-flight briefing for the same flight or series of flights, the FDP of the cabin crew may be extended by the difference in reporting time between the cabin crew and the flight crew, as long as the difference does not exceed 30 minutes and the reporting time for flight crew and cabin crew fall in the same circadian time category.

Reason: In order to take into account latest scientific and technical evidence (see answer to question 5 of the MOEBUS study) operators should develop more efficient briefing techniques; when approving a flight time specification scheme proposing different reporting times for flight and cabin crew the Agency should pay special attention to the fact that this extension of the maximum FDP can only be used where strictly safety related duties make this necessary.

**CS FTL.1.135 Maximum daily Flight Duty Period (FDP)  
(a)**

Again, compared to EU OPS, Subpart Q, the delta is up to -1:10; Example: start of duty 17:00 / 5 legs / duty enters WOCL for 1:40 as of it's end -> according EU OPS FDP may be up to 10:40.

EASA allows here 09:30 !!!!!

What is the safety justification for that?

Coming to the table itself: There appears to be some consistency issue here - at least there is no formula distillable from it.

It appears "strange", that havin 5 legs results in a longer allowable FDP if the the duty shift is located a a later time of the day and/or even within the WOCL.

What is the logic behind this table, why further reductions from EU OPS / "Q", where is any scientific justification?

**(b)**

comment by: *Juergen Hauk*

Today, the german authority offers by law the possibility for a so called "**Split-Duty-Period**".

It is regulated by 1.DVLuftBO §11 and it offers a duty period of max 18 hours, provided within that period ...

(a) there is "Pause", allowing a minimum of 3 hours to sleep in a quiet room and

(b) the total flight time (before and after the pause) is not more than 10 hours.

**This "tool" is very useful for commercial charter and taxi services**, so in the early morning passengers can be flown to their "meeting" and the same crew can take the passengers back home in the evening.

EXAMPLE: Reporting time 0500, Flight from A to B from 0545 to 0945, Pause from 1000 to 1615, Flight from B to A from 1700 to 2100, End of duty time at 2115;

RESULT: Duty period is 16:15 hours, Total flight time is 8:00 hours, Pause period is 6:15 hours, thereof 5:00 hours were spent in a hotel room ("effective pause").

From my point of view, **this "t ool" does not get i n conflict with any scientifically based fatigue-related risk**, as long as ...

(a) the "Split-Duty-Period" does not touch the period from 0100 to 0459 local time and

(b) the following rest period before underaking the next FDP is at least as long as the "Split-Duty-Period" minus the included "Effective Pause", or 10 hours, whichever is the greater. (In the given example, the required rest period would be: 16:15 hours minus 5:00 hours equals 11:15 hours)

I suggest implementing this german tool "Split-Duty-Period" (\*) as an extra subparagraph into CS FTL.1.135.

(\* May be you will find a better name ...)

Once again a small change but with profound effects. Though this is a comprehensible adaption to the existing rules which all apply to consecutive time periods, in this case it leads to fatal complications. The yearly flight time is influenced by the periods of leave. Current regulations entitle the crew members to 6 weeks paid leave p.a. Periods of wished leave have to be taken into account by the operator. Above rule would oblige the operator to grant leave every year in the same month, which lacks the consideration of social aspects and would be without any practical orientation. As a result staff demand would otherwise rise by approximately 10-13% (900:12months = 75/month; 900:10,5months = 85/month), because operators have to be prepared for the worst case, that crewmembers spread their leave over the calendar year with the effect of having no leave planned in a period of 12 months. These costs have a high economic and unacceptable impact on the operators.

comment 463 comment by: *Condor Flugdienst GmbH - FRA HO/R*  
 Acc. to CFG please replace "any 12 consecutive calendar months" by "one calendar year". See also CFG comment to OR.OPS.0.40 FTL.

comment 547 comment by: *SCCA/ head of health and safety*

- **A limit of 180 duty hours per 28 consecutive days.** Scientific research has established that fatigue and the risk of accidents and injuries increases over successive work days, and that these increases are dissipated over periods of rest days. As the Moebius report concluded, there is not enough scientific evidence to support the figure of 190 duty hours per 28 consecutive days as safe enough to avoid cumulative fatigue in cabin crew.
- **An additional limit of 100 duty hours in 14 days should be included to guarantee that duty hours are spread not only as evenly as possible but also in a manner that allows for proper rest and time at home.**

The proposed text allows for 60 duty hours per 7 consecutive days leading to the possibility of 3 consecutive 60 hour weeks within a period of 28 days.

- The permitted 900 block hours should be measured over a 12 consecutive calendar month period and not a natural year. This will avoid flying 1800 hours in 18 months.

The proposed limit of 100 block hours per 28 consecutive days seems far too high: for instance, the French CAA established a limit of up to 95 block hours per calendar month which would equal 85 block hours per 28 consecutive days.

comment 742 comment by: *Luftfahrt-Bundesamt*

The LBA does not agree to move EU-OPS in a CS, due to its legal uncertainty, even when the Basic Regulation asks for a CS.  
 We herewith request to establish a clear legal situation by keeping the FTL – Requirements in the Implementing Rules.  
 The FTL rules as proposed do not include requirements for corporate operations with non-complex motor powered aircraft. This is not acceptable as pilots of these aircraft deserve the same protection against fatigue as their colleagues in larger aircraft.  
 Justification: see LBA - General Comment, reasons 1 and 2

comment by: ECA - European Cockpit Association

Comment on CS FTL.1.140(a): change as follows:

The total duty periods to which a crew member is assigned shall not exceed:

(1) 60 duty hours in any seven consecutive days;

**(2) 100 duty hours in 14 consecutive days.**~~(2)~~ **(3)** 190 duty hours in any 28 consecutive days.

Justification:

Add provision for 14 consecutive days as per answer to question 1 of Moebus study.

The scientific evaluation recommends under Question 1 the setting of/an additional restriction of '100 duty hours in 14 consecutive days'

comment

1168

comment by: ECA - European Cockpit Association

Comment on CS FTL.1.140(c): Move provision to IR, and add cross-reference to WTD : « Should typically not exceed 48 hours within any 7 consecutive days. »

Justification:

Previously "... *spread as evenly as practicable ...*" was only applicable to the 190 hours in 28 days limit. It is too weak as the rule generally does not protect against abuse which could induce fatigue (uncontrolled workload increase; unacceptable level of risk exposition).

Also, it should remain in the IR, rather than being downgraded to GM status.

Further we suggest a cross reference to consider the limit from the Working Time Directive for "normal" Workers:

"Should typically not exceed 48 hours within any 7 consecutive days."

comment

1230

comment by: Sven Freisenich

**Flight Times and Duty periods (a)**

To provide flexibility due different reporting times for cabin crew and flight crew in case of unforeseen delays, cabin crew have an additional 5 hours per any seven consecutive days.

CS FTL.1.140 Flight times and duty periods

(a) The total duty periods to which a crew member is assigned shall not exceed:

(1) 60 (65 for cabin crew) duty hours in any seven consecutive days;

(2) 190 (210 for cabin crew) duty hours in any 28 consecutive days

**Justification: UK CAP371**

Motivation: The safety tasks of flight crew and cabin crew are different: cabin crew are re-active while flight crew more pro-active. Cabin crew shall never be the limiting factor with respect to flight times and duty periods.

**Flight Times and Duty Periods (b)**

This text is more restrictive than EU-OPS Subpart Q text which refers to 900 hrs in a calendar year. The safety argument is lacking.

Revert back to EU-OPS text which is in line with the EU Working Time Directive by replacing „any 12 consecutive calendar months“ by „one calendar year“.

Due to diverging demand in winter season and summer season no balance possible. LTU is highly subject to seasonal effects, e.g. peak during summer season. The „one calendar year“ as in EU-OPS and Working Time Directive (Council Directive 2000/79/EC) reduces the problem to a one-time exercise at the end of the calendar year, i.e. in the winter low season. The EASA proposed „12 consecutive months“ present however an unnecessary continuing challenge, also during the summer peak. Note that this summer peak is not driven by the operator, but by the market itself, e.g. hard working families and tax payers going on well deserved summer holidays.

CS FTL.1.140 Flight times and duty periods

(b) The total flight time of the flights on which an individual crew member is assigned as an operating crew member shall not exceed:

- (1) 100 flight hours in any 28 consecutive days;
- (2) 900 flight hours in a calendar year.

The „900 hours in any 12 consecutive months“ are not specified by ICAO and is more restrictive than the EU Working Time Directive EC 2000/79 Clause 9:

“Without prejudice to Clause 3, mobile staff in civil aviation shall be given days free of all duty and standby, which are notified in advance, as follows:

- a) at least seven local days in each calendar month, which may include any rest periods required by law; and
- b) at least 96 local days in each calendar year, which may include any rest periods required by law.

There is no safety justification given for the additional requirement, which will lead to reduced flexibility in particular when planning crew members' leave.

Finally, Certification Specification CS FTL.1.140 (a) and (b)(1) will avoid any intended abuse of the „one calendar year“. The intent is already covered by 1.140 (c).

**Flight Times and Duty Periods (c)**

The text, not stated in the original EU-OPS subpart Q regulations, is described vaguely and does not have any added value.

CS FTL.1.140 Flight times and duty periods

There isn't any differentiation between Flight Crew and Cabin Crew. BA's current Scheme for Cabin Crew allows higher duty limits than Flight Crew. Currently our National Authority (CAA) allows for higher duty hours limits for Cabin Crew than Flight Crew. We see no justification to move away from this existing position.

Remove item (c) for the same reason as laid out in OR.OPS.040.FTL.

**CS FTL.1.140 Flight times and duty periods**

~~(a) The total duty periods to which a crew member is assigned shall not exceed:~~

~~(1) 60 duty hours in any seven consecutive days;~~

~~(2) 190 duty hours in any 28 consecutive days.~~

Replace: (a) The total duty periods to which a crew member is assigned shall not exceed:

(1) 60 duty hours in any seven consecutive days;

(2) 180 duty hours in any 28 consecutive days.

(3) 100 duty hours in any 14 consecutive days.

**Reason:** See reason for proposed change to **OR.OPS.040.FTL**. An additional limit of 100 duty hours in any 14 consecutive days should be introduced in the CS guarantee that duty is spread out as evenly as possible. (See answer to question 1 MOEBUS study).

(b) The total flight time of the flights on which an individual crew member is assigned as an operating crew member shall not exceed:

- (1) 100 flight hours in any 28 consecutive days;
- (2) 900 flight hours in any 12 consecutive calendar months.

**Comment:** The limits reflected in (b) should be reflected in IR; they are to be considered substantive provisions of Subpart Q EU OPS and BR 216/2008 Art. 22, 2. (a) and should therefore be included in IR.

(c) The total duty periods and total flight times referred to in (a) and (b) above should be spread as evenly as practicable throughout their respective periods.

**Replace:** possible

Reason: The word practicable leads to the conclusion that this only should be done where no additional cost is generated. The present OPS is intended to avoid cumulative fatigue and increase flight safety. Operators should be encouraged to do everything **possible** within their operational limits to comply with this.

#### **CS FTL.1.155 Minimum Rest Period**

(a) Minimum rest period at home base.

The minimum rest period provided before undertaking a flight duty period starting at home base is at least as long as the preceding duty period, or 12 hours, whichever is the greater.

(b) Minimum rest period away from home base.

The minimum rest period provided before undertaking a flight duty period starting away from home base is at least as long as the preceding duty period, or 10 hours, whichever is the greater. The minimum rest period away from home base includes an 8 hour sleep opportunity taking account of travelling and other physiological needs

(c) Recurrent extended recovery rest periods

The minimum recurrent extended recovery rest period to compensate for cumulative fatigue is a 36hour period including two local nights, such that there are never more than 168 hours between the end of one recurrent extended recovery rest period and the start of the next.

**Comment:** The provisions of this CS should be included in IR as they are substantive provisions of Subpart Q EU OPS (BR 216/2008 Art. 22, 2. (a)).

The Moebus report indicates that a 14-day duty hour limit should be set - we concur with this view. This would, in effect, also help operators "spread (work) as evenly as practicable" as stated in this section.

Please define "..spread as evenly as practicable.."

We feel that a maximum number of duty hours per 12 consecutive calendar months should also be incorporated in this section or is this area covered in the Council Directive 2000/79/EC concerning the European Agreement on the Organisation of Working Time of Mobile Workers in Civil Aviation?

comment by: *Swedish Transport Agency, Civil Aviation Department (Transportstyrelsen, Luftfartsavdelningen)*

**Paragraph text:**

(a) The total duty periods to which a crew member is assigned shall not exceed:

- (1) 60 duty hours in any seven consecutive days;
- (2) 190 duty hours in any 28 consecutive days.

**Comment:**

In order to ensure that the assigned duty hours are spread evenly during 4 weeks based on 190 hours divided by 4 weeks (which results in 47,5 hours per week) a new text should be added about maximum assigned hours in any seven consecutive days. Our experience shows that the operator's crew scheduling staff are not following the current wording in EU-OPS Subpart Q OPS 1.1100 1.1 (a) "spread as evenly as practicable throughout this period". Therefore a restriction is needed for the planning part (47,5 hours). During the execution of the week it may be allowed to work up to 60 hours.

Furthermore a new limitation for maximum duty hours during 14 days should be inserted between (1) and (2) in order to ensure that fatigue induced days are not unevenly spread during 4 weeks like 60 hours, 60 hours, 60 hours and 10 hours the last week. The proposed limit for 14 days are 190 hours divided by 2 weeks which results in 95 hours. This proposal is line with the Moebus

report on Subpart Q although the Moebus report proposed 100 hours in 14 consecutive days without any supporting grounds. To use 95 hours is better because it is based on the Subpart Q rule about "spread as evenly as practicable throughout this period".

**Proposal** (including *new text*):

(a) The total duty periods to which a crew member is assigned shall not exceed **47,5 planned (rostered) duty hours in any seven consecutive days;**

The ~~maximum total duty periods~~ hours ~~to which~~ **for** a crew member is assigned shall not exceed:

- (1) 60 duty hours in any seven consecutive days;
- (2) 95 duty hours in any 14 consecutive days;**
- ~~(2 3)~~ 190 duty hours in any 28 consecutive days.

**Comment:**

The wording '900 hours in any 12 consecutive calendar months is more restrictive than the EU Working Time Directive. This is unacceptable in particular since ICAO is not setting any limit which means most non-EU airlines can do much more than 900h. The additional restriction have no safety justification and would lead to reduced flexibility in particular when planning the crew member leave..

**Proposal:**

Stick to the EU working time directive '900h in 1 calendar year'

comment by: *Air Berlin PLC & Co. Luftverkehrs KG*

To provide flexibility due different reporting times for cabin crew and flight crew in case of unforeseen delays, cabin crew have an additional 5 hours per any seven consecutive days.

**CS FTL.1.140 Flight times and duty periods**

(a) The total duty periods to which a crew member is assigned shall not exceed:

- (1) 60 (65 for cabin crew) duty hours in any seven consecutive days;
- (2) 190 (210 for cabin crew) duty hours in any 28 consecutive days

**Justification: UK CAP371**

Motivation: The safety tasks of flight crew and cabin crew are different: cabin crew are re-active while flight crew more pro-active. Cabin crew shall never be the limiting factor with respect to flight times and duty periods.

**Flight Times and Duty Periods (b)**

This text is more restrictive than EU-OPS Subpart Q text which refers to 900 hrs in a calendar year. The safety argument is lacking.

Revert back to EU-OPS text which is in line with the EU Working Time Directive by replacing „any 12 consecutive calendar months“ by „one calendar year“.

Due to diverging demand in winter season and summer season no balance possible. Air Berlin is highly subject to seasonal effects, e.g. peak during summer season. The „one calendar year“ as in EU-OPS and Working Time Directive (Council Directive 2000/79/EC) reduces the problem to a one-time exercise at the end of the calendar year, i.e. in the winter low season. The EASA proposed „12 consecutive months“ present however an unnecessary continuing challenge, also during the summer peak. Note that this summer peak is not driven by the operator, but by the market itself, e.g. hard working families and tax payers going on well deserved summer holidays.

**CS FTL.1.140 Flight times and duty periods**

(b) The total flight time of the flights on which an individual crew member is assigned as an operating crew member shall not exceed:

- (1) 100 flight hours in any 28 consecutive days;
- (2) 900 flight hours in a calendar year.

The „900 hours in any 12 consecutive months“ are not specified by ICAO and is more restrictive than the EU Working Time Directive EC 2000/79 Clause 9:

“Without prejudice to Clause 3, mobile staff in civil aviation shall be given days free of all duty and standby, which are notified in advance, as follows:

- a) at least seven local days in each calendar month, which may include any rest periods required by law; and
- b) at least 96 local days in each calendar year, which may include any rest periods required by law.

There is no safety justification given for the additional requirement, which will lead to reduced flexibility in particular when planning crew members' leave.

Finally, Certification Specification CS FTL.1.140 (a) and (b)(1) will avoid any intended abuse of the „one calendar year“. The intent is already covered by 1.140 (c).

**Flight Times and Duty Periods (c)**

The text, not stated in the original EU-OPS subpart Q regulations, is described vaguely and does not have any added value.

**CS FTL.1.140 Flight times and duty periods**

Deleted (c )

comment by: ANE (Air Nostrum) OPS QM

CS FTL 1.140.

- b) 2) 900 flight hours in any 12 consecutive months
  - o This new limit would not be generate any problem if our crew enjoying their 30 day holidays split into 12 months, it means 2,5 days per month. Nevertheless, as this seems almost impossible, it would generate hiring more crew to avoid our current crews going

beyond this new limit in 12 consecutive months.

Recent EASA presentations regarding options for future FTL scheme for CAT operations [RM task OPS 055] means this section remains under review. A lack of response at this time should not be interpreted as tacit acceptance of Section VIII. We reserves the right to come back to EASA on Section VIII once the options issue has been settled. We understand that the Agency are planning separate Rule making activity in regard to FTL and wish to re-iterate that we would welcome Industry participation.

FTL.1.155 Minimum Rest Period**

p. 35

comment 134

comment by: Rega / Swiss Air-Ambulance

**CS.FTL.1.155 Minimum Rest Time and Rest Period**

**Scope:**

Rephrase the term "Rest Period" to "Rest Time". Continue to use the EU-OPS term "Rest Period".

**Text to be added/altered:**

**CS.FTL.1.155 Minimum Rest Time and Rest Period**

**(a) Minimum rest time at home base**

**The minimum rest time** provided before undertaking ... rest of text no change

**(b) Minimum rest time away from home base**

**The minimum rest time** provided before undertaking ... rest of text no change

**(c) Minimum rest period**

**The minimum rest period** to compensate for cumulative fatigue is a 36-hour period including two local nights, such that there are never more than 168 hours between the end of one **rest period** and the start of the next.

**Proof:**

The terms "Rest Time" and "Rest Period" are under EU-OPS well established and understood in the aviation community. It makes no sense to alter this well known terms; there is no gain in safety.

For Swiss Air Ambulance it is economically unbearable to alter and adapt all the computer programs assisting the operations for no reason with the from EASA proposed terms.

**Background:**

Swiss Air Ambulance is a subsidiary of Rega, Switzerland's national air-rescue organisation, which was founded in 1952. Swiss Air Ambulance can draw on decades of experience and the expertise of professional teams to provide competent, comprehensive assistance in the event of medical emergencies all over the world operating besides 13 dedicated HEMS helicopters 3 dedicated Bombardier CL-604 "Challenger" ambulance jets with a range of 3'500 NM. Its services range from providing medical advice to repatriating patients to/from Switzerland or any other point of the world. Swiss air-ambulance is a private, non-profit organisation, which operates in accordance with the guiding principles of the Red Cross. It comes to the aid of people in distress, without respect of their nationality, religious conceptions or social status. Swiss air-ambulance operates under the Air Operator Certificate CH-AOC-No.1015 issued by the Federal Office of Civil Aviation Switzerland (FOCA) and is compliant with EU-OPS. - **Any rest away from home base that is less than 12 hours shall include the entire WOCL. The subsequent FDP shall be reduced by the extent of the amount of the reduction of the rest period. The following rest period shall be increased by the amount of reduction of the prior rest period.**
- **On return to home base from long-haul operations the rest shall at least include 4.5 times the difference in local times between the home base and the location with the greatest local time difference where a rest period was taken. This shall be followed by the minimum weekly rest period of 36 hours.**
- **When the home base rest is designed after an FDP that includes three or more time zones, and the next consecutive duty schedule crosses from east to west or vice versa and cover three or more time zones, the two weekly night's sleeps must be increased by one more night sleep.**
- **The minimum rest should not be under 14 hours including one local night during layovers after significant time zone crossing (3 or more time zones).**
- **Split duties (extended FDP due to a break in an adequate rest facility on the ground) potentially combine the adverse effects of prolonged duty periods with those of reduced rest periods. They should be carefully monitored and only be permitted under the following circumstances:**
  - **The break between the two sub-duties should be at least one third of the length of the total flight duty period including at least 4 hours at the sleeping facility. If the sector immediately before the break ends in the WOCL or the sector after the break starts in the WOCL, at least 6 hours at the sleeping facility shall be included. In this case no more than 2 sectors shall be operated after the break.**
  - **Adequate sleeping facilities must be provided by the operator.**

An adequate sleeping facility shall allow for optimum rest being individual accommodation, acoustically insulated, temperature regulated, with private shower and WC and have eating and drinking facilities. Any time spent on travelling from the aircraft to the rest facility and back shall be accounted for as FDP.

- **The total flight duty period of a split duty should never start before 06:00 or end after 22:00.**
- **The rest break shall never be at home base. Extensions due to in-flight rest and due to a break on the ground shall not be combined in one FDP. In operations that include significant time zone crossing (3 or more time zones) no**

**extensions to the maximum FDP shall be granted due to a break on the ground.**

- **The rest period before and after a split duty shall not be reduced and shall include at least the local night.**

It has been established that both fatigue and risk build up over the course of a duty, such that they are substantially higher at the end of longer duties. It is also scientifically established that the body clock has a major impact on (both sleep) the propensity and duration of sleep. The ability to fall asleep and the subsequent sleep duration are significantly impaired at sub-optimal conditions (i.e. during daytime). Finally, it has been established that if insufficient sleep has been obtained between consecutive duties then fatigue and risk will increase. Split duties should only need special provisions and guidelines when they result in an extension of the total flight duty period, i.e. from reporting for the first flight to "engines off & disembarking of passengers at the end of the last flight.

- **The weekly rest period should dissipate fatigue by allowing two local night sleeps. The second night sleep must not be shortened in order to have an early start. A local night shall be defined as a period of 10 hours falling between 22:00 and 10:00.**

**Minimum Rest Period (a)**

Maintain the wording of EU-OPS

**EU- OPS 1.1110.1 Rest**

**CS FTL.1.155 Minimum Rest Period**

1. Minimum rest

1.1. The minimum rest which must be provided before undertaking a flight duty period starting at home base shall be at least as long as the preceding duty period or 12 hours whichever is the greater;

EU-OPS 1.1110 Rest

**Minimum Rest Period (b)**

Maintain the wording of EU-OPS

**EU- OPS 1.1110.1 Rest**

1.2. The minimum rest which must be provided before undertaking a flight duty period starting away from home base shall be at least as long as the preceding duty period or 10 hours whichever is the greater; when on minimum

rest away from home base, the operator must allow for an eight hour sleep opportunity taking due account of travelling and other physiological needs;  
EU-OPS 1.1110 Rest

### **Minimum Rest Period (c)**

There is no definition for "cumulative fatigue". There is no safety argument to link "recurrent extended recovery " rest periods with "cumulative fatigue".

To quote the Moebus study on page 27: "Question 10: The effects of the format of rest periods on cumulative fatigue (ref. EU-OPS 1.1110 para 2.1)...In the absence of direct scientific evidence, it is not possible to provide clear guidance on the relationship between cumulative fatigue and the frequency of days off."

Maintain the wording of EU-OPS

### **EU- OPS 1.1110.2 Rest Periods**

#### **CS FTL.1.155 Minimum Rest Period**

(c) Recurrent extended recovery rest periods

An operator shall ensure that the minimum rest provided as outlined above is increased periodically to a weekly rest period, being a 36-hour period including two local nights, such that there shall never be more than 168 hours between the end of one weekly rest period and the start of the next. As an exception, the second of those local nights may start from 20:00 hours if the weekly rest period has a duration of at least 40 hours.

EU-OPS 1.1110.2

There is no scientifically based argument to link cumulative fatigue and frequency of days off.

comment by: *Richard ALLEN*

(a) the proposed periods of duty and of rest are wholly unsuitable for hot air ballooning. Commercially passenger balloon flights are typically around an hour in duration, which is in the main far less than the duration of a commercial fixed wing flight. Also, a minimum of 12 hours for rest would typically mean that a balloon pilot could only fly once a day. For balloon safety, a rest period as long as the preceding duty period would be sufficient.

**CS FTL.1.155 Minimum Rest Period  
THE CFDT France asks for this to be included in IR**

The provisions of this CS should be included in IR as they are substantive provisions of Subpart Q EU OPS (BR 216/2008 Art. 22, 2. (a)).

(a) Minimum rest period at home base.

The minimum rest period provided before undertaking a flight duty period starting at home base is at least as long as the preceding duty period, or 12 hours, whichever is the greater.

(b) Minimum rest period away from home base.

The minimum rest period provided before undertaking a flight duty period starting away from home base is at least as long as the preceding duty period, or 10 hours, whichever is the greater. The minimum rest period away from home base includes an 8 hour sleep opportunity taking account of travelling and other physiological needs

(c) Recurrent extended recovery rest periods

The minimum recurrent extended recovery rest period to compensate for cumulative fatigue is a 36hour period including two local nights, such that there are never more than 168 hours between the end of one recurrent extended recovery rest period and the start of the next.

Thess duty rest periods are excessive when applied to flight operations for a balloon, even large balloons. Pilots do not suffer the same fatigue as those flying longhaul international flights.

So balloons should be omitted from these rigorous requirements. Barry Birch, Balloon Pilot/Instructor, Italy.

- Due to the nature of balloon flight timings where it is normal to have a flight in the early morning followed by a rest period and then another flight in the evening the proposed rest periods of a minimum of twelve hours would make two flights a day impossible.
- There should be a separate set of FTL rules for hot air ballooning.

comment 2823 comment by: BALPA

Section (a) identifies the rest requirement "...before undertaking a *flight duty period*.". This doesn't seem to take into consideration ground duties. Therefore, can a standby that is unused be followed by another standby starting, for example, 4 hours later? If so, this is blantly nowhere near the minimum rest requirement between two flying duties so what's the difference between flying and ground duties! Our concern highlighted in OR.OPS.050 FTL regarding the definition of "designated" rest periods is again raised. This needs to be clarified carefully to ensure safety is upheld.

Secton (b) We are concerned that the levels proposed here are too low and feel operators should prove, through FRMS, that safety isn't compromised.

Section (c) The amount of time required between two 168 hour work periods, is only one "Recurrent extended recovery rest period" of 36 hours. Whilst any FRMS system will identify that this is too low, we believe at least 2 consecutive days off per 14 days and 7 days off within any 4 consecutive weeks (with an average of 8 days off in each consecutive 4 week period, averaged over 3 periods) should be the absolute minimum. We require the Agency to take a more prescriptive view in this section.

<p>Maintain the wording of EU-OPS <b>EU- OPS 1.1110.1 Rest</b></p> <p><b>CS FTL.1.155 Minimum Rest Period</b> 1. Minimum rest 1.1. The minimum rest which must be provided before undertaking a flight duty period starting at home base shall be at least as long as the preceding duty period or 12 hours whichever is the greater;</p> <p>EU-OPS 1.1110 Rest</p> <p>1.2. The minimum rest which must be provided before undertaking a flight duty period starting away from home base shall be at least as long as the preceding duty period or 10 hours whichever is the greater; when on minimum rest away from home base, the operator must allow for an eight hour sleep opportunity taking due account of travelling and other physiological needs;</p>		

There is no definition for "cumulative fatigue". There is no safety argument to link "recurrent extended recovery " rest periods with "cumulative fatigue".

To quote the Moebus study on page 27: "Question 10: The effects of the format of rest periods on cumulative fatigue (ref. EU-OPS 1.1110 para 2.1)...In the absence of direct scientific evidence, it is not possible to provide clear guidance on the relationship between cumulative fatigue and the frequency of days off."

Maintain the wording of EU-OPS

**EU- OPS 1.1110.2 Rest Periods**

**CS FTL.1.155 Minimum Rest Period**

(c) Recurrent extended recovery rest periods

An operator shall ensure that the minimum rest provided as outlined above is increased periodically to a weekly rest period, being a 36-hour period including two local nights, such that there shall never be more than 168 hours between the end of one weekly rest period and the start of the next. As an exception, the second of those local nights may start from 20:00 hours if the weekly rest period has a duration of at least 40 hours.

EU-OPS 1.1110.2

There is no scientifically based argument to link cumulative fatigue and frequency of days off.

comment by: Tyrolean Airways

Compared to EU OPS / Q the table is identical, but "Q" allows some flexibility here for the NAAs. That makes sense, as in our opinion this was due to the idea, that any NAA will know the needs the aviation industry in the specific country and must determine what is acceptable in regards to safety. Compared to the limits currently approved from the NAAs, there will be a significant reduction (up to 4 hours!!!!!!)

**Comment**  
Any differentiation between rest requirements applicable at a home base versus away from home base has no basis in safety and must be removed.  
**Proposal**  
(4) "In the event of such circumstances, the rest period following the FDP may be reduced by a maximum of 2 hours but never below 10 hours"

comment 462 comment by: *Condor Flugdienst GmbH - FRA HO/R*  
According to Condor Flugdienst GmbH the whole para is confusing! The first two numbers of article (a) are contradictory. EASA should clarify this whole para.  
Article (2) refers to FTL 1.135 (d) which does not exist!

comment 677 comment by: *easyjet safety*  
Comment: provisions 1 and 2 are unclear. There is no CS.FTL.1.135 (d)  
Proposal: Amend to read:  
1: The maximum daily FDP which results after applying CS.FTL.1.135 (a) and where applicable (c) may not be increased by more than two hours unless the crew has been augmented in which case the maximum flight duty period may be increased by not more than three hours.  
2: The maximum daily FDP which results after applying CS.FTL.1.135 (b) and where applicable (c) may not be increased by more than one hour unless the crew has been augmented in which case the maximum flight duty period may be increased by not more than two hours.  
Comment: Provision 4 limits the use of discretion to reduce rest to those circumstances where the FDP has been extended.  
Proposal: Amend to read: "Rest periods may be reduced at home base and away from base but never below the minimum defined in CS.1.155(b)"

comment 684 comment by: *Dassault Aviation*  
Editorial comment.  
Page 35 CS FTL.1.160 §(a)(1) [resp. (a)(2)]: the reference to CS FTL.1.135(b)

and (c) [resp. CS FTL.1.135(b), (c) and (d)] is in error and should instead read CS FTL.1.135(a) and (c) [resp. CS FTL.1.135(b) and (c)].

comment 692 comment by: *Dassault Aviation*

Technical comment.

Page 35 CS FTL.1.160(a)(1) [resp. (a)(2)]: in unforeseen circumstances, in case the flight crew has been augmented, the text says that the maximum FDP may be increased by not more than 3 hours [resp. 2 hours]. This provision can not be applied, since the proposed CS FTL.1 does not give maximum FDP in the case there is an augmented flight crew - CS FTL.1 only gives provision for minimal crew. EASA should first develop maximum FDP in the case there is an augmented flight crew. Second, do the 3 hours [resp. 2 hours] can be cumulated as many times as there are additional qualified pilots in the augmented flight crew (for example, if the augmented flight crew is composed of 3 qualified pilots, can the increase be 9 hours [resp. 6 hours] ?)

comment 703 comment by: *Civil Aviation Authority of Norway*

The relationship between the provisions in subsection (1) and subsection (2) seems unclear.

There is no subparagraph (d) in CS.FTL.1.135. The reference to this subsection does therefore seem to be an error.

comment 704 comment by: *Civil Aviation Authority of Norway*

Comment to subsection (a)(4):

It should be specified in a clearer manner if the phrasing "minimum rest" refers only to the 12/10 hour limit, or if the rest period must be as long as the preceding duty, if this is more than 12/10 hours.

comment 744 comment by: *Luftfahrt-Bundesamt*

The LBA does not agree to move EU-OPS in a CS, due to its legal uncertainty, even when the Basic Regulation asks for a CS.

We herewith request to establish a clear legal situation by keeping the FTL – Requirements in the Implementing Rules.

The FTL rules as proposed do not include requirements for corporate operations with non-complex motor powered aircraft. This is not acceptable as pilots of these aircraft deserve the same protection against fatigue as their colleagues in larger aircraft.

Justification: see LBA - General Comment, reasons 1 and 2

comment 1120 comment by: *AEA*

**Comment:** There seems to be some contradiction in the text (ref CS.FTL.1.135(d) does not exist). In addition, the text is not consistent with EU-OPS

**Proposal:** Add 2 h extension to the max applicable FDP for basic flight crew and 3h extension to the max applicable FDP for augmented flight crew (3 pilots or more)

(tbd)

comment

1188

comment by: ECA - European Cockpit Association

Comment on CS FTL.1.160 (a): change as follows:

The conditions for the modification of the limits on flight duty, duty and rest periods by the pilot in command in the case of unforeseen circumstances in actual flight operations, and after the reporting time, shall comply with the following:

(1) The maximum basic daily FDP which results after applying CS FTL.1.135 ~~(a) (b) and (c)~~ may not be increased by more than two hours unless the flight crew has been augmented, in which case the maximum flight duty period may be increased by not more than 3 hours;

~~(2) The maximum basic daily FDP which results after applying CS FTL.1.135 (b), (c) and (d) may not be increased by more than one hour unless the flight crew has been augmented, in which case the maximum flight duty period may be increased by not more than 2 hours;~~

(3) If on the final sector within a FDP unforeseen circumstances occur after take off that will result in the permitted increase being exceeded, the flight may continue to the planned destination or alternate;

(4) In the event of such circumstances, the rest period following the FDP **finishing away from base** may be reduced but never below the minimum rest period defined in CS FTL.1.155 (b).

Justification:

The intention of the paragraph becomes unclear as the references seem to be incorrect:

In paragraph (1):

CS FTL.1.135 (b) refers to an extended FDP only;

CS FTL.1.135 (c) refers to an FDP with different reporting time for flight crew and cabin crew.

In paragraph (2):

CS FTL.1.135 (d) does not exist.

Furthermore, rest at home base shall not be reduced, for any reason. Staffing must be adequate to cope with the aftermath at the home base. The proposed change in paragraph (4) reflects this.

comment

1236

comment by: Sven Freisenich

### **Unforeseen circumstances in actual flight operations – discretion by pilot in command**

Should be (a) and (c). OPS 1.1120.1 does not specify who shall made the decision to extend, but only specifies such decision shall be acceptable to the PIC. The EASA NPA specifies this decision shall be made by the PIC. The operator shall still be able to propose extensions to the PIC, subject to PIC's acceptance.

Should be (b) and (c). CS FTL.1.160 references to CS FTL.1.135 are wrong

(e.g. CS FTL.1.135 (d) does not exist).

Replace "such" by "unforeseen". If not, (4) will not be possible if the PIC has not extended the previous FDP. PIC should be able to reduce rest period without necessarily having increased the previous FDP.

**CS FTL.1.160 Un foreseen circumstances in actual flight operations – discretion by pilot in command**

Maintain wording of EU-OPS 1.1120, but replacing the reference to "1.1105.1.3" by "maximum basic FDP of 13 hours".

EU-OPS 1.1120.1.1 clearly refers to 1.1105.1.3 i.e. maximum basic FDP of 13 hours.

The (ab)use of the discretion by the PIC is monitored: EU-OPS 1.1120.1.3.2. requires the PIC whenever the increase of a FDP or reduction of a rest period exceeds one hour, to file a report, to which the operator must add his comments, and provide to the Competent Authority no later than 28 days after the event. Last but not least, such events will also be considered under the operator's FRMS, part of its SMS.

comment by: British Airways

(a) (1) Replace entire item with current wording in BA Scheme. There isn't any need to add further constraints to the existing words.

*The maximum FDP for either a single sector duty or a multi-sector duty may be extended by up to 3 hours, at the commander's discretion. If a Flying Duty Period involving 2 or more sectors up to a maximum of 2 hours discretion may be exercised prior to the start of the first and subsequent sectors. On a single sector flight or immediately prior to the last sector on a multi-sector flight, a maximum of 3 hours extension may be exercised. An extension of 3 hours is the maximum permitted, except in cases of emergency (see Note).*

*Note: 1. In respect of an extension of a flying duty period, an emergency is a situation which in the judgement of the commander presents a serious risk to the health or safety of crew and passengers, or endangers the lives of others*

In item (a) (2) there is a reference to CS.FTL.1.135 (d) - this item does not exist in the NPA document.

(b) Replace the whole sentence with - *The pilot in command should take note of the circumstances of all crew members before deciding these modifications.*

**CS FTL.1.160 Un foreseen circumstances in actual flight operations – discretion by the pilot in command**

(a) The conditions for the modification of the limits on flight duty, duty and rest periods by the pilot in command in the case of unforeseen circumstances in actual flight operations, and after the reporting time, should comply with the following:

(1) The maximum basic daily FDP which results after applying CS FTL.1.135 (b) and (c) may not be increased by more than two hours unless the flight crew has been augmented, in which case the maximum flight duty period may be increased by not more than 3 hours;

~~(2) The maximum basic daily FDP which results after applying CS FTL.1.135 (b), (c) and (d) may not be increased by more than one hour unless the flight crew has been augmented, in which case the maximum flight duty period may be increased by not more than 2 hours;~~

(3) If on the final sector within a FDP unforeseen circumstances occur after take off that will result in the permitted increase being exceeded, the flight may continue to the planned destination or alternate;

(4) In the event of such circumstances, the rest period following the FDP may be reduced but never below the minimum rest period defined in CS FTL.1.155 (b).

~~(b) The pilot in command should consult all crew members before deciding these modifications.~~

**THE CFDT France asks for Replacement** : flight and cabin

**Reason:** When developing CS the Agency should reflect scientific and technical knowledge, The MOEBUS study in the answer to question 5 quotes numerous recent scientific studies showing that cabin crew are more likely to be affected by hypoxia and other fatigue increasing factors than flight crew, therefore and in order to guarantee a satisfactory level of alertness in the cabin crew towards the end of the FDP the use of the provisions in CS FTL.1.160 should be limited to flights with augmented flight and cabin crew. From the viewpoint of general health, physiological needs, and required levels of alertness, the same requirements for flight and cabin crew should be applied.

**Delete: (2)**

**Reason:** CS FTL.1.135 (d) does not exist therefore there is no difference between (1) and (2).

Replace: (b) The pilot in command should consult all crew members before deciding these modifications. At least the minimum number of cabin crew defined in OR.OPS.105.CC and OR.OPS.205.CC should have declared in the consultation to feel sufficiently free of fatigue to continue their duty beyond the established maximum FDP defined in **OR.OPS.335.FTL Flight Duty Period**

**(FDP) and CS FTL.1.135 Maximum daily Flight Duty Period (FDP).**

**Reason:** The ER laid down in 7.f. of Annex IV to BR 216/2008 establishes a personal responsibility to all crew members: 7.f. No crew member must allow their task achievement/decision making to deteriorate to the extent that flight safety is endangered because of the effects of fatigue, taking into account, *inter alia*, fatigue accumulation, sleep deprivation, number of sectors flown, night duties or time zone changes. Rest periods must provide sufficient time to enable crew members to overcome the effects of the previous duties and to be well rested by the start of the following flight duty period.

**European Regions Airline Association Comment**

Recent EASA presentations regarding options for future FTL scheme for CAT operations [RM task OPS 055] means this section remains under review. A lack of response at this time should not be interpreted as tacit acceptance of Section VIII. ERA reserves the right to come back to EASA on Section VIII once the options issue has been settled.

The ERA Directorate understand that the Agency are planning separate Rule making activity in regard to FTL and wish to re-iterate that the Directorate would welcome Industry participation in providing 'expert' input'.

comment by: BALPA

Whilst this section mentions flight crew augmentation, the document does not detail the processes used, or extensions available, if such a practice is used. Has this been left out by mistake?

Section (2) - states that CS FTL.1.135 (b), (c) and (d) should be applied. However, there is no section CS FTL.1.135 (d) in this NPA so we are unable to comment on this paragraph.

comment

comment by: Austro Control GmbH

Clarification of Point (a) (1) and (2) is needed, since CS FTL.1.135 (a) is not mentioned and CS FTL.1.135 (d) is not available.

New text suggested:

(1) The maximum basic daily FDP which results after applying CS FTL.1.135 (a) may not be increased by more than two hours unless the flight crew has been augmented, in which case the maximum flight duty period may be increased by not more than 3 hours;

(2) The maximum basic daily FDP which results after applying CS FTL.1.135 (b) (c) may not be increased by more than one hour unless the flight crew has been augmented, in which case the maximum flight duty period may be increased by not more than 2 hours;

comment

3163

comment by: Lufthansa CityLine GmbH

### CS FTL.1.160 ( a ) (1)+(2)

According to OPS 1.1120, 1.1. the commander may increase the maximum daily FDP in case of unforeseen circumstances referring to OPS 1.1105 point 1.3 (13 hours) up to two hours and three hours if the flight crew has been augmented.

There is no reference to OPS 1.1105 1.4. and 1.5.

German Authorities confirmed that reductions for sectors and encroaching on the WOCL do not apply in those circumstances.

(1) Taking the maximum FDP after applying CS FTL.1.135 (b) as (c) as "basic FDP" would reduce the flexibility needed in unforeseen circumstances in an unacceptable way. The difference between the limits according to OPS 1.1120 and CS FTL.1.160 (a) (1) + (2) in some cases is more than two hours.

Results would be of heavy economical impact for operators and cause great disadvantages for passengers. Delays forced by crew changes out of crew bases and unplanned overnight stays of passengers and crews would increase significantly.

(2) CS FTL 1.135 (d) does not exist

comment

3184

comment by: DGAC

(a) :

**Proposal** : Amend the references in (a)(1) and (a)(2) as follows :

"(1) The maximum basic daily FDP which results after applying CS FTL.1.135 (a) ~~(b)~~ and (c) may not be increased by [...];

(2) The maximum basic daily FDP which results after applying CS FTL.1.135 (b) ~~and~~, (c) ~~and~~ ~~(d)~~ may not be increased by [...];"

**Justification:** It is not operationally applicable to reduce the margin on TSV that have been increased due to augmented crew that allows for in-flight rest, because the longer the flight is, the higher the likelihood of unexpected circumstances to occur will be.

Generally speaking, to avoid inaccurate references to CS FTL.1.135 it could be better to refer to « the maximum **applicable** flight duty period »

comment by: cfdt france

**CS FTL.1.160 Un foreseen circumstances in actual flight operations – discretion by the pilot in command**

(a) The conditions for the modification of the limits on flight duty, duty and rest periods by the pilot in command in the case of unforeseen circumstances in actual flight operations, and after the reporting time, should comply with the following:

(1) The maximum basic daily FDP which results after applying CS FTL.1.135 (b) and (c) may not be increased by more than two hours unless the flight crew has been augmented, in which case the maximum flight duty period may be increased by not more than 3 hours;

~~(2) The maximum basic daily FDP which results after applying CS FTL.1.135 (b), (c) and (d) may not be increased by more than one hour unless the flight crew has been augmented, in which case the maximum flight duty period may be increased by not more than 2 hours;~~

(3) If on the final sector within a FDP unforeseen circumstances occur after take off that will result in the permitted increase being exceeded, the flight may continue to the planned destination or alternate;

(4) In the event of such circumstances, the rest period following the FDP may be reduced but never below the minimum rest period defined in CS FTL.1.155 (b).

~~(b) The pilot in command should consult all crew members before deciding these modifications.~~

**Replace with: "flight and cabin"**

**Reason:** When developing CS the Agency should reflect scientific and technical knowledge, The MOE BUS study in the answer to question 5 quotes numerous recent scientific studies showing that cabin crew are more likely to be affected by hypoxia and other fatigue increasing factors than flight crew, therefore and in order to guarantee a satisfactory level of alertness in the cabin crew towards the end of the FDP the use of the provisions in CS FTL.1.160 should be limited to flights with augmented flight and cabin crew. From the viewpoint of general health, physiological needs, and required levels of alertness, the same requirements for flight and cabin crew should be applied.

**Delete: (2)**

**Reason:** CS FTL.1.135 (d) does not exist therefore there is no difference between (1) and (2).

**Replace:** (b) The pilot in command should consult all crew members before deciding these modifications. At least the minimum number of cabin crew defined in OR.OPS.105.CC and OR.OPS.205.CC should have declared in the consultation to feel sufficiently free of fatigue to continue their duty beyond the established maximum FDP defined in OR.OPS.335.FTL Flight Duty Period (FDP) and CS FTL.1.135 Maximum daily Flight Duty Period (FDP).

**Reason:** The ER laid down in 7.f. of Annex IV to BR 216/2008 establishes a personal responsibility to all crew members: 7.f. "No crew member must allow their task achievement/decision making to deteriorate to the extent that flight safety is endangered because of the effects of fatigue, taking into account, *inter alia*, fatigue accumulation, sleep deprivation, number of sectors flown, night duties or time zone changes. Rest periods must provide sufficient time to enable crew members to overcome the effects of the previous duties and to be well rested by the start of the following flight duty period."

(a) The conditions for the modification of the limits on flight duty, duty and

rest periods by the pilot in command in the case of unforeseen circumstances in actual flight operations, and after the reporting time, should comply with the following:

(1) The maximum basic daily FDP which results after applying CS FTL.1.135 (b) and (c) may not be increased by more than two hours unless the flight crew has been augmented, in which case the maximum flight duty period may be increased by not more than 3 hours;

~~(2) The maximum basic daily FDP which results after applying CS FTL.1.135 (b), (c) and (d) may not be increased by more than one hour unless the flight crew has been augmented, in which case the maximum flight duty period may be increased by not more than 2 hours;~~

(3) If on the final sector within a FDP unforeseen circumstances occur after take off that will result in the permitted increase being exceeded, the flight may continue to the planned destination or alternate;

(4) In the event of such circumstances, the rest period following the FDP may be reduced but never below the minimum rest period defined in CS FTL.1.155 (b).

~~(b) The pilot in command should consult all crew members before deciding these modifications.~~

**THE CFDT France asks for Replacement** : flight and cabin

**Reason:** When developing CS the Agency should reflect scientific and technical knowledge, The MOEBUS study in the answer to question 5 quotes numerous recent scientific studies showing that cabin crew are more likely to be affected by hypoxia and other fatigue increasing factors than flight crew, therefore and in order to guarantee a satisfactory level of alertness in the cabin crew towards the end of the FDP the use of the provisions in CS FTL.1.160 should be limited to flights with augmented flight and cabin crew. From the viewpoint of general health, physiological needs, and required levels of alertness, the same requirements for flight and cabin crew should be applied.

**Delete: (2)**

**Reason:** CS FTL.1.135 (d) does not exist therefore there is no difference between (1) and (2).

Replace: (b) The pilot in command should consult all crew members before deciding these modifications. At least the minimum number of cabin crew defined in OR.OPS.105.CC and OR.OPS.205.CC should have declared in the consultation to feel sufficiently free of fatigue to continue their duty beyond the established maximum FDP defined in **OR.OPS.335.FTL Flight Duty Period (FDP)** and **CS FTL.1.135 Maximum daily Flight Duty Period (FDP)**.

**Reason:** The ER laid down in 7.f. of Annex IV to BR 216/2008 establishes a personal responsibility to all crew members: 7.f. No crew member must allow their task achievement/decision making to deteriorate to the extent that flight safety is endangered because of the effects of fatigue, taking into account, *inter alia*, fatigue accumulation, sleep deprivation, number of sectors flown, night duties or time zone changes. Rest periods must provide sufficient time to enable crew members to overcome the effects of the previous duties and to be well rested by the start of the following flight duty period.

p35 **CS FTL.1.160 Unforeseen circumstances in actual flight operations – discretion by pilot in command**

Should be (a) and (c). OPS 1.1120.1 does not specify who shall made the decision to extend, but only specifies such decision shall be acceptable to the PIC. The EASA NPA specifies this decision shall be made by the PIC. The operator shall still be able to propose extensions to the PIC, subject to PIC's acceptance.

Should be (b) and (c). CS FTL.1.160 references to CS FTL.1.135 are wrong (e.g. CS FTL.1.135 (d) does not exist).

Replace "such" by "unforeseen". If not, (4) will not be possible if the PIC has not extended the previous FDP. PIC should be able to reduce rest period without necessarily having increased the previous FDP.

**CS FTL.1.160 Un foreseen circumstances in actual flight operations – discretion by pilot in command**

Maintain wording of EU-OPS 1.1120, but replacing the reference to "1.1105.1.3" by "maximum basic FDP of 13 hours".

EU-OPS 1.1120.1.1 clearly refers to 1.1105.1.3 i.e. maximum basic FDP of 13 hours.

The (ab)use of the discretion by the PIC is monitored: EU-OPS 1.1120.1.3.2. requires the PIC whenever the increase of a FDP or reduction of a rest period

exceeds one hour, to file a report, to which the operator must add his comments, and provide to the Competent Authority no later than 28 days after the event. Last but not least, such events will also be considered under the operator's FRMS, part of its SMS.

comment 4011 comment by: ANE (Air Nostrum) OPS QM

CS FTL 1.160.

- o In CS FTL 1.160 (a) (4) it is stated that in unforeseen circumstances in actual flight, after reporting time, the rest period may be reduced but never below the minimum rest period defined in CS FTL.1.155 (b). **It would be clearer if it was written 10 hours.**

Recent EASA presentations regarding options for future FTL scheme for CAT operations [RM task OPS 055] means this section remains under review. A lack of response at this time should not be interpreted as tacit acceptance of Section VIII. We reserves the right to come back to EASA on Section VIII once the options issue has been settled. We understand that the Agency are planning separate Rule making activity in regard to FTL and wish to re-iterate that we would welcome Industry participation.

EASA NPA 2009-02c - **CS FTL.1.160**  
**Unforeseen circumstances in actual flight operations – discretion by the pilot in command**

(a) The conditions for the modification of the limits on flight duty, duty and rest periods by the pilot in command in the case of unforeseen circumstances in actual flight operations, and after the reporting time, should comply with the following:

- (4) In the event of such circumstances, the **rest period** following the FDP **may be reduced** but never below the minimum rest period defined in CS FTL.1.155 (b).

Note: The minimum rest period as defined in CS FTL.1.155(b) is: "... **at least as long as the preceding duty period, or 10 hours, whichever is the greater ...**"

This paragraph combined with

EASA NPA 2009-02c - **CS FTL.1.155 - Minimum Rest Period**

(a) ... The minimum rest period provided before undertaking a flight duty period starting at **home base** is at least as long as the preceding duty period, or **12 h**, whichever is the greater.

results in the fact, that a reduction of the rest time down to the basic minimum acc. to CS FTL.1.160(a)(4) may only apply to flights to the home base.

So, for a better overview, it might be an idea to cancel the subparagraph CS FTL.1.160(a)(4) and to add its text to subparagraph CS FTL.1.155(a).

In that case, CS FTL.1.160 would apply only to increase the max basic daily FDP, not any longer to reduce any rest period.

**HOWEVER**, I was wondering why the required rest time is longer at the home base, and I guess it is because of the distance between the home base airport and the home of each crew member, which might not be close to the airport.

Therefore I do have another proposal: Take away completely the possibilities for commanders to reduce the rest time and therefore change the requirement for the Min Rest Period as follows:

EASA NPA 2009-02c - **CS FTL.1.155 - Minimum Rest Period**

(a) ... The minimum rest period provided before undertaking a flight duty period starting at home base is at least as long as the preceding duty period, or 12 h, whichever is the greater. The period might be reduced to the minimum as defined in (b), if the operator provides facilities for rest (hotel).

(b) ...

This would be of interest at least for charter and taxi service.

comment by: *IACA International Air Carrier Association*

General comments

EASA seems to have taken an approach to downgrade the hard-time limits of Subpart Q of EU-OPS into Certification Specifications. The hard-time limits of Subpart Q provided for a minimum level of harmonisation at EU level and should remain part of the Implementing Rule. This is essential to ensure a level playing field within the EU market. Moreover, the EU Legislator clearly spelled out in the Basic Regulation not to change EU-OPS Subpart Q which was only implemented on 16<sup>th</sup> July 2008.

The EASA proposal to remove limits from hard law to CSs is intended to provide for flexibility to suit different kinds of operations. But, until EASA confirmed themselves as an independent safety regulator, IACA prefers to maintain the technical content of EU-OPS in the Implementing Rule. The need for any rulemaking activity shall be identified in a safety case and supported by a correct regulatory impact assessment; and not be biased and/or influenced by social considerations.

comment by: *Novair/Nordic Safety Analysis Group*

**2009-07-31**  
**Kjäll**

**Novair/Nordic Safety Analysis Group, Hans**

**Comments on NPA 2009-02c**

**V. DR AFT DECISI ON AMC A ND GM TO PART – ORG ANISATION REQUIREMENTS****(PARTOR)****Acceptable Means of Compliance (AMC) and Guidance material (GM) to PartOR****Safety analysis in the NPA regulations**

These comments of the NPA gives support for improvements of the text where risk analysis is required and may be reflected in the regulation text and in advisory chapters.

The main principle should be indicated in the text in order to direct the analysis resources into *relevant* areas. The safety management system should use a *risk matrix* indicating the normal risk distribution using an empirical way of specifying relevant items and give them a risk value based on the probability for having a fatal accident per hour and year. The probability distribution of those items should be based on the present empirical probability for the European aviation for having a fatal accident, i.e.  $1,0 \times 10^{-7}$  per hour and year. The total sum of the risks for all specified items should be given the specified probability of  $1,0 \times 10^{-7}$ . That means that all normal operation risks should be expressed by the risk values thus derived in such a risk matrix.

The risk assessment process should then focus of *significant changes* in the operational profile and maintenance, which means that all empirical received reports within the quality system must be analyzed and fed into the risk matrix. The changes in risk values as a result of changed environment should be derived by a group of experts within the company with experience of the operations and maintenance area as well as analysis. Also economical and tactical factors may be defined in the matrix and significant changes may reflect risk impacts.

The regulations should reflect the *methodology and the risk targets* used more specifically. The risk target for an operator can for example be defined as the latest 3-5 years mean value of the European aviation risk levels or better for the type of operation concerned.

It is *essential* that risk analysis resources are spent in areas where there are *expected changes in risk and not just formally analyzed*.

Areas where there should be special attention are changes in route structure, i.e. airspace, additional destination aerodromes and alternate aerodromes. Facilities and environment matters which may have an impact should be evaluated and prioritized for such changes.

The regulations do not mention *security* specifically in these chapters, but should be added in the regulation text and also stressing, that security items should be defined in the item risk matrix for the operation. It should furthermore be expressively said that *security audits* should be performed and consequently risk analysis should be performed for every new aerodrome and airspace segment added in the route structure. The risk analysis should be prioritized for routes overflying or being a destination in countries with known low security or safety level. Such security risk analysis should also include risk judgments derived from the *political situation* in the country and the general risk for terror attacks directed to civil aviation or other ware fare. In the security risk analysis it is also important to estimate the risk of *military interference* of different type to civil aviation, which may be a result from active combat or training activities.

As a result of the prioritized analysis, compensating actions have to be performed in significant areas shown by the analysis, which fits in the present NPA of regulations for directing the company's organization of their SMS.

**Comment:**

There should be only one definition of cabin crew which should be fully in line with Subpart O of EU-OPS (EU-OPS 1.988)

**Proposal:**

Add to the generic part a definition of cabin crew to read as 'Cabin Crew Member means any crew member, other than a flight or technical crew member, who performs in the interests of safety of passengers duties assigned to him/her by the operator or the commander in the cabin of an aircraft.'

comment 4056 comment by: *Ingo Pucks*

The definition of the content, processes, tasks and involvement of operational control is neglecting the current work environment, resources and methods available, and by that not aimed at maximizing the effect a well educated, equipped and motivated work force could have on flight operation. This section lacks a description of advantages coming from flight ops support in the way the FAR 121 generates it.

It is proposed to amend it as follows:

"The operations manual shall include the means and methods and the processes, by which during the initialization, planning, continuing, termination, diversion or accident of a flight operational control is exercised.

The operations manual shall contain resources and information available for conducting safe and efficient flight operation.

comment 2793 comment by: *European Federation of Airline Dispatcher's Associations*

Attachment [#38](#)

The European Federation of Airline Dispatcher's Associations proposes the following changes as attached.

comment 2974 comment by: *Gregor Rozina*

The operator should take action to change a schedule or crewing ~~arrangements~~ where the actual operation exceeds the maximum flight duty period, during a scheduled seasonal period, by more than:

Replace: arrangements, the latest

Reason: The AMC as proposed initially by the Agency is less restrictive than the corresponding OPS in Subpart Q EU OPS; its intention should be to correct

schedule or crewing arrangements as soon as the operator realizes that a certain flight operation exceeds the maximum flight duty period in a significant number (33%) of scheduled flights and not after completing an entire season.

comment

There is a new requirement for risk management, What is its relationship with SMS ?

comment

4069

comment by: *Ingo Pucks*

1 - see comments made in AMC OR.OPS.100.GEN(b)

2- Neglecting the positive impact of licenced dispatch personnel would be like asking for no licences needed for flight crews. hence it is proposed here to define the necessity of licensed flight dispatch personnel. It is of utmost importance the topic flight dispatch licensing is made a EU-wide initiative. Furthermore a flight watch system (the right terminus would be ASD - aircraft situational display) including a MET and ATC overlay can increase the safety and efficiency of every operator's flight operation. It is strongly suggested to include a requirement for operators to conduct operational control also through such tools. Accidents like Hapag Llyod in Vienna, varous Crossair flights, AFR 447 and alike show the necessity of including and connecting information available on the ground and on board the aircraft, and that is best done through a comprehensive ASD.

3 - this is not only important for FOO but all personnel is safety critical areas of ground and flight operations, especially flight dispacth, ops control and mass & balance. a requirment for a detailed training and recurrent scheme shall be included in the operations manual.

Point 3:

An ICAO conforming definition is suggested for:

e. *Hazard* Condition, object or activity with the potential of causing injuries to personnel, damage to equipment or structures, loss of material or reduction of ability to perform a prescribed function.

i. *Risk* The likelihood of injury to personnel, damage to equipment or structures, loss of material or reduction of ability to perform a prescribed function, measured in terms of probability and severity.

Justification:

globally used definitions facilitate a global understanding.

comment 1389 comment by: *SCCA/ head of health and safety*

comment 1401 comment by: *UK CAA*

**Page No:** 36 – 49

**Paragraph No:** GM OR.OPS.100.GEN(d)

**Comment:** The intent of this paragraph is not clear. It should constitute guidance on how an operator may comply with:

OR.OPS.100.GEN(d)

The operator shall establish procedures and instructions for the safe operation of each aircraft type, containing ground staff and crew member duties for all types of operation on the ground and in flight. These procedures shall not require crew members to perform any activities during critical phases of flight other than those required for the safe operation of the aircraft.

However, GM OR.OPS.100.GEN(d) deals only with "SOP" in the context of a very complex framework of hazard and risk assessment. SOP, as normally understood, is the set of procedures to be used by flight crew in the operation of the aircraft, and is only a subset of the global procedures required by OR.OPS.100.GEN(d). Furthermore, the specific and detailed hazard and risk assessment framework is inappropriate here. Section 2 – Management of NPA 2008-22c sets out the general requirements for Safety Management Systems (SMS) for organisations. There appear to be conflicts between GM OR.OPS.100.GEN(d) and AMCs 1 & 2 to OR.GEN 200(a)(3). This GM should refer as necessary to the AMC material in giving guidance on the full range of procedures and instructions for safe operation.

**Justification:** Removal of apparent inconsistencies between the regulation, AMC and this guidance material.

1. **GM OR.OPS.100.GEN (d)**

5.2.3. Industry standard/best practice

If an industry best practice exists for a particular type of operation, its applicability and suitability should be evaluated by the operator. This evaluation could provide valuable input to the SOP and risk assessment.

Some industry best practices (code of practices/COP) are developed specifically to function as basis for SOPs and should have associated hazard lists and proposals for treatment of relevant safety risks. Operators developing SOPs based on such industry standard/best practice should still perform their own risk assessment to ensure the COP is suitable and customised to their own operation. **The competent authority has to be informed, before an industry standard will be used, to decide if the industry standard would be an Acceptable Means of Compliance to the Implementing Rules following AR.GEN**

**Comment:**

Whenever industry standards are referenced in the GM, than it shall be clear that either the competent authority has to verify that this standard is acceptable to show compliance with the rule or the Agency has to verify compliance with the rule following an Art 52 rulemaking process.

comment by: *Swiss International Airlines / Bruno Pfister*

**Relevant Text:**

"When applying to the competent authority for alternative means of compliance including a SOP, the risk assessment should be enclosed to document the development process."

**Comment:**

This is guidance material is too prescriptive and outlines one possible approach for SOPs. In many aspects this guidance material would not be practical, it should differentiate between small and large changes. Most of the changes

performed are of small scale, the proposed provision is too cumbersome for small changes.  
Also the location of this guidance material should therefore be reconsidered e.g. it should be withdrawn from this NPA e.g. not be linked as guidance material for compliance with a specific rule.

**Proposal:**

Delete the guidance material and consider publication as information paper without linking it to a specific rule and differentiating between small and large changes.

**Comment CAA-NL:**

Reference to "awareness training" is inappropriate.

**Justification:**

Part 1 Chapter 4 of the ICAO Technical Instructions details the dangerous goods training requirements for all categories of staff and makes no mention of "awareness training", only that personnel must be trained "commensurate with their responsibilities".

**Proposed Text (if applicable):**

"2 Training programmes should be commensurate with the responsibilities of personnel.

- comment 583 comment by: *International Air Transport Association*  
 AMC OR.OPS.100.GEN(f) 2.  
 The sentence is grammatically wrong and also refers to "awareness" training, which while awareness is widely used in the industry is not defined and is not used in any regulatory text. In addition it is sufficient to simply state that training must be commensurate with responsibility.  
 Proposed revision as follows:  
 "2. Training programmes should be commensurate with the responsibilities of personnel."
- comment 595 comment by: *Luftfahrt-Bundesamt*  
 Adequate Training requirements are already defined in the ICAO Technical Instructions.

comment by: CAA-NL

Comment regarding:

2. The OM may vary in detail in accordance with the complexity of the operation and of the type and number of aircraft operated

Proposal CAA-NL:

Add:

Refer at least to the AMC's containing the OM content requirements. Also add the role of the local competent authority during approval process.

Reason:

Unclear till what detail the OM may be varied.

Comment regarding:

6 The OM or parts thereof may be presented in any form, including electronic form. In all cases, the accessibility, usability and reliability should be assured.

Proposal CAA-NL:

Add:

Reference to Electronic Flight Bag requirements is required.

Reason:

New rules should encompass developments on electronic flight bags.

Comment regarding:

10 The OM may be compiled in accordance with an industry code of practice.

Proposal CAA-NL:

Add:

Text should read that operations manuals may contain procedures based on industry codes.

Reason:

The text can be read that the entire ops manual can be replaced by 'industry codes'. This is not desirable.

comment

351

comment by: CAA-NL

Layout proposal CAA-NL:

AMC's 1, 2 and 4 should be combined into one (1) AMC.

Develop one (1) AMC based on AMC5 and mention at individual requirement if alleviations are allowed for operations with non-complex aircraft together with deviations/additional information required for COM operations.

A second AMC can be developed for non-com/complex aircraft however these OM requirements should have the same structure as mentioned in AMC5 only on lower level of detail.

Reason:

Current set-up with the AMC 1 till 6 is very unclear.

Text is sometimes unnecessarily duplicated; requirements may be combined

and differently ordered.

comment 745 comment by: *Luftfahrt-Bundesamt*

The LBA does not accept the downgrading of Subpart P in JAR-OPS 1 / JAR-OPS 3 in an AMC. The current rule status guarantees a uniform application. We herewith request to re-establish this situation.

Justification: see LBA - General Comment, reasons 1 and 2.

Most operators have moved to electronic documentation. This requirement should be satisfied either by soft or hard copy (electronic files/paper copy)

**Proposal:**  
Modified wording to ensure that electronic and/or paper copies satisfies this requirement

comment 1374 comment by: *Pietro Barbagallo ENAC*

Comment: AMC1 OR.OPS.015.MLR (3) This item should be moved at requirements level.

Justification: The circumstance that less conservative data than an approved data (e.g. AFM) cannot be used is a matter of fact. The initial meaning of the EU OPS requirement was to give responsibility to the operator in preparing his own Operations Manual in compliance with TCH documents.

comment

1403

comment by: UK CAA

**Page No:** 50

**Paragraph No:** AMC1 OR.OPS.015.MLR

**Comment:** AMC 1 OR.OPS.015.MLR paragraphs 5 and 9 provide that the operating manual may be issued in separate parts and that if it contains all relevant information, the AFM need not be carried. But the rule contains no requirement concerning whether it may or may not be issued in parts or whether it should be carried. Indeed, if there is a rule that it should be carried, an AMC may not provide that it need not be carried. Not carrying an AFM cannot conceivably be a means of complying with a rule that it must be carried.

CGT member of ETF

**AMC OR.OPS.015.FTL(I) Operator responsibilities**

The operator should take action to change a schedule or crewing arrangements where the actual operation exceeds the maximum flight duty period, during a scheduled seasonal period, by more than:

**Replace:** arrangements, the latest

**Reason:** The AMC as proposed initially by the Agency is less restrictive than the corresponding OPS in Subpart Q EU OPS; its intention should be to correct schedule or crewing arrangements as soon as the operator realizes that a certain flight operation exceeds the maximum flight duty period in a significant number (33%) of scheduled flights and not after completing an entire season.

The OM forms an integral part of the operator's procedures and process description. It is suggested that an EU-wide standard is defined which includes the relevant parts and sections in relation to safety and efficiency. Therefore the OM should be quality controlled through a committee consisting of personnel of all relevant departments involved in flight operation, flight operation support and ground operation.

**5.2.5** Pilot unde supervision

**5.2.6** System panel operator

**5.2.7** Operation on more than one type or variant

**Proof:**

Under AMC OR.OPS.015.FC (d) it is explained, by whom the co-pilot may be relieved.

**Background:**

Swiss Air Ambulance is a subsidiary of Rega, Switzerland's national air-rescue organisation, which was founded in 1952. Swiss Air Ambulance can draw on decades of experience and the expertise of professional teams to provide competent, comprehensive assistance in the event of medical emergencies all over the world operating besides 13 dedicated HEMS helicopters 3 dedicated Bombardier CL-604 "Challenger" ambulance jets with a range of 3'500 NM. Its services range from providing medical advice to repatriating patients to/from Switzerland or any other point of the world. Swiss air-ambulance is a private, non-profit organisation, which operates in accordance with the guiding principles of the Red Cross. It comes to the aid of people in distress, without respect of their nationality, religious convections or social status. Swiss air-ambulance operates under the Air Operator Certificate CH-AOC-No.1015 issued by the Federal Office of Civil Aviation Switzerland (FOCA) and is compliant with EU-OPS. comment by: EHOc

**Paragraph A General/Basic**Paragraph 2.5

Editorial: The element on the accident prevention and flight safety programme has been removed but the numbers have not been adjusted.

The numbering might include 2.4 with 'not used' to preserve the original OM numbering scheme.

Paragraph 8.4

Although the change of language from AWO to LVO is understood in the context of Approvals, most operators will still be conducting AWO (not LVO) and therefore this section might be renamed to AWO with the original text.

"8.4 AWO. A description of the operational procedures associated with All Weather Operations."

Paragraph 11.4

The text that provides for reporting Dangerous Goods incidents has been removed from the original wording: the wording might better be:

"Procedures for verbal notification to air traffic service units of incidents involving ACAS RAs, bird hazards, **dangerous goods** and hazardous conditions;"

**Paragraph B Aircraft Operating Matters - Type related**Paragraph 4.1.2

In the original helicopter text, there was an insert to the text that acknowledge that, for some operations, other operational data might have to be supplied - e.g. Information provided for PC2 or procedures used for offshore operations. A suggest text might be appended:

"For helicopters, if performance Data, as required for the appropriate performance class, is not available in the approved HFM, then other data acceptable to the Authority should be included."

Comment regarding:

Part A

1.2 Nominated post holders. The name of each nominated post holder responsible for flight operations, crew training and ground operations, as prescribed in OR.OPS.210.AOC. A description of their function and responsibilities should be included.

Proposal CAA-NL:

Add:

Add the nominated postholder Maintenance.

Reason:

Nominated postholder Maintenance is not mentioned.

Comment regarding:

Part A

2.1.3 Control, analysis and storage of the required records.

Proposal CAA-NL:

Add:

Clarify the meaning "Records"

Option: All documents relevant to the day-to-day operation such as, but not limited to .....shall be stored with a minimum of 3 months after day of initiation.

Reason:

EU OPS Appendix 1 to OPS 1.1045 mentions: "...flight documents, additional informations and data."

Appendix 1 to OPS 1.1065 also mentions: "Information (OFP, ATL, M&B ed), Reports"

Comment regarding:

Part A section 2

Proposal CAA-NL:

Add:

Add 2.4. Accident Prevention and Flight Safety Program.

Reason:

Artikel 2.4 is missing; EU-OPS and JAR-OPS 3 incorporates a requirement sect. 2.4 "Accident Prevention and Flight Safety Program".

Comment regarding:

Part A

8.2.2.(k). Multiple occupancy of helicopter seats.

Proposal CAA-NL:

Add:

Change helicopter into aircraft.

Reason:

Why specifically helicopter; this also applies for aeroplanes.

Comment regarding:

Part B section arrangement

Proposal CAA-NL:

Add:

Has it been decided to structure Part B according JAR-OPS 3?

Reason:

Current AMC5 Part B has been arranged according JAR-OPS 3 and not EU-OPS.

Comment regarding:

Part C

k. For aeroplane operations, aerodrome categorisation for flight crew competence qualification and

Proposal CAA-NL:

Add:

Extend the requirement with helicopter operations

Reason:

Also helicopters make use of specific operating sites/areas which requires competences

Comment regarding:

<page 63 bottom>

If there are sections which, because of the nature of the operation, do not apply, it is recommended that operators maintain the numbering system described above and insert 'Not applicable' or 'Intentionally blank' where appropriate.

Proposal CAA-NL:

Add:

Issue guidelines to be used by the authorities when empty sections in OM's are acceptable.

Reason:

This statement may introduce differences in OM approvals and interpretations between the various member states. What is acceptable?

comment by: CAA-NL

**Comment Regarding 9.1.2**

**Comment CAA-NL:**

**The text** does not address the specific requirements for the loading of dry ice and radioactive material.

**Justification:** Part 7;4.2 of the Technical Instructions requires an operations or other suitable manual to detail a) the maximum quantity of dry ice permitted in each compartment; and b) if radioactive material is to be carried, instructions on the loading of such dangerous goods based on the requirements of 7;2.9 of the Technical Instructions.

**Proposed Text**

"9.1.2 Guidance on the requirements for acceptance, labelling, handling, stowage and segregation of dangerous goods, including the maximum quantity of dry ice permitted in each compartment and, if radioactive material is to be carried, instructions on loading based on the requirements of Part 7;2.9 of the Technical Instructions "

comment 584

comment by: *International Air Transport Association*

AMC5 OR.OPS.015.MLR 9.1.2

The text in this subparagraph refers to "labelling". Labelling is the shipper's responsibility, the operator is only able to validate that the labels applied to packages containing dangerous goods conform with the Technical Instructions based on what has been described on the dangerous goods transport document.

Proposed amendment, delete the word "labelling" for the text.

In addition the broad provisions described in 9.1 omit a number of key requirements that are set out in part 7;4.2 in the ICAO Technical Instructions, which includes information such as the details and locations of cargo compartments; the maximum limit of dry ice that may be loaded in any cargo compartment; and instructions on loading of radioactive materials to ensure sufficient separation from persons on board the aircraft.

Proposed amendment. Insert a new subparagraph 9.1.7 as follows:

"9.1.7 Details of the location and numbering system of cargo compartments together with:

- a. the maximum quantity of dry ice permitted in each compartment; and
- b. if radioactive material is to be carried, instructions on the loading of such dangerous goods based on the requirements of part 7;2.9 of the ICAO Technical Instructions."

comment 585

comment by: *International Air Transport Association*

AMC5 OR.OPS.015.MLR 9.1.5

This subparagraph only refers to the duties of personnel in accordance with OPS.SPA.DG, however an operator not holding an approval to carry dangerous goods may still be in the situation of identifying dangerous goods in cargo where the goods were undeclared by the shipper or misdeclared as general cargo. In addition there are many items of dangerous goods that are permitted in passenger baggage. For this reason there should also be duties of personnel in accordance with OPS.GEN.030.

comment 596

comment by: *Luftfahrt-Bundesamt*

No 9.1.2 should be concretized by adding the following:

9.1.2. Guidance on the requirements for acceptance, labelling, handling, stowage and segregation of dangerous goods; **including the maximum quantity of dry ice permitted in each compartment and, if radioactive**

**material is to be carried, instructions on loading based on the requirements of the current version of the ICAO Technical Instructions**

- comment 749 comment by: *Luftfahrt-Bundesamt*

comment by: *ERA*

**European Regions Airline Association Comment**

ERA members have been in the forefront of applying pressure on EASA to develop without delay rulemaking action on aircraft ground de-icing / anti-icing

operations. EASA consider this and other areas of this NPA provide provisions that may meet the concerns related to any lack of current individual rulemaking activity in this area. The ERA Directorate would disagree and stress that EASA as a matter of urgency should be looking at rulemaking action.

There is a need for explicit statements on the establishment of procedures and methods to be considered for incorporation.

comment 3196

comment by: DGAC

The last sentence of AMC 5 states (page 63) that "OM compiled in accordance with Annex III of Regulation 3922/91 are considered to be acceptable". This kind of grandfathering provision can not be addressed through (and hidden in) an AMC but shall be in the Cover regulation.

comment 3198

comment by: DGAC

**(A.8.7) Non revenue flights.**

The provisions on "procedures and limitations for non revenue flights" should be further developed, taking into account the recommendation made to EASA by the BEA in its preliminary report following the accident involving the Airbus A320-232 registered D-AXLA operated by XL Airways Germany that occurred on 11 of November 2008 off the coast of Canet Plage (France):

"that EASA detail in the EU-OPS the various types of non-revenue flights that an operator from a EU state is authorised to perform, that EASA require that non-revenue flights be described precisely in the approved parts of the operations manual, this description specifically determining their preparation, programme and operational framework as well as the qualifications and training of crews, and that as a temporary measure, EASA require that such flights be subject to an authorisation, or a declaration by the operator, on a case-by-case basis."

comment by: *Ryanair*

Nothing in this AMC should require an existing, approved operator to redesign their approved operations manual

10 - Security - this section requires review and amendment that it does not conflict with the Requirements of Regulation (EC) 300/2008.

Security programme - Regulation (EC) 300/2008 already requires Operators to develop and implement a security programme. Any requirement to include elements of this programme in the operations manual must be removed. Otherwise operators may be subjected to duplicated information and approval processes.

#### **Comment - 7.1**

The EASA proposal to require a Fatigue Risk Management System (FRMS) for all types of operations is impractical and will lead to mandated consultation with all 'interested parties' even for the most minor of changes to schedules operated approved FTL Schemes.

The concept of FRMS is a draft ICAO proposal. It is intended for Ultra Long Range Flights that go beyond the limits of current and proposed EU FTL Requirements. The implementation of FRMS should only be considered in the context of URL Ops.

#### **Proposal**

7.1 - Flight and Duty Time Limitations and Rest Requirements. The scheme developed by the operator in accordance with OR.OPS.230.FTL or OR.OPS.330.FTL and, for Ultra Long Range Operations, a description of the corresponding Fatigue Risk Management System (FRMS).

 This comment addresses issues related to the Operations Manual (AMC5 OR.OPS.015.MLR).

The comment was discussed during the EASA/EBAA Workshop July 9, 2009 in Cologne. The workshop participants, both from EASA and EBAA received the comments favourably.

Operations Manual: Comment to NPA 2009-02c

This comment addresses issues related to the Operations Manual (OR.OPS.015.MLR). The comment was discussed during the EASA/EBAA Workshop July 9, 2009 in Cologne. The workshop participants, both from EASA and EBAA received the comments favourably.

1. Positive changes in NPA 2009-02 compared to EU-OPS:

- OR.OPS.015.MLR(h): The operator now is permitted to implement minor amendments to the Operations Manual in accordance with a specified amendment procedure. This is positive and avoids minor amendments to be submitted on a case by case basis to the Authority.
- GM to OR.GEN.200(a)(6) and AMC1 OR.OPS.015.MLR: The principle of not duplicating information in several manuals is positive. However, if information is not to be duplicated, access to the location of the information needs to be granted. This implies the need for a publication system, which allows navigation across various manuals. The Operations Manual (OM) may be an integral part of the Organisation Manual required in OR.GEN.200(a)(6).
- Structure of OR.OPS: Based on the explanations of Eric Sivel during the EASA/EBAA workshop in Cologne July 9, 2009, it became clear that the structure and chapter system is intended to support the use of data bases. This is a good starting point to integrate the regulations into an automated compliance management by operators.
- AMC1 OR.OPS.015.MLR(6): It is positive that no additional permission as in EU-OPS 1.1040(m) for the publication in other than printed paper is required.
- AMC2 OR.OPS.015.MLR(1) and (4): It is positive that parts of the OM can be substituted by applicable parts of the AFM, or, where such documents exist, by an AOM produced by the manufacturer of aircraft. Referencing from the OM into other material is especially for smaller operators a good solution to avoid lengthy, costly and error-prone copy-paste solutions.

2. Positive changes in NPA 2009-02:

- Terminology and abbreviations: Both the Operations Manual and the Organisation Manual tend to be abbreviated as OM. Suggestion to replace the term "Organisation Manual" by "Management Manual".
- Integration with IOSA standards not reflected: OR.GEN and OR.OPS require the establishment of manuals. Since many operators follow also IOSA standards, it would be a simplification if the interaction and commonality of the manuals required by both systems would be reflected in an EASA AMC/GM.
- AMC5 OR.OPS.015.MLR A 5.5: The title in A 5.5 should be harmonised with D 2.4. Suggestion to delete the words "other than flight crew" in the brackets.
- AMC5 OR.OPS.015.MLR: No change to EU-OPS 1.1045 and its Appendix 1 to OPS 1.1045. This AMC5 proposes a Table of Contents of Operations Manual. The design and the content of this Table of Contents of an Operations Manual was (under EUOPS) and is (under Part-OPS) not user-friendly and leads to confusion. It mixes various headings of an OM with instructions on information which needs to be inserted. Experience shows that an OM based on App.1 to OPS 1.1045 does not allow to present the information in an organic way by

following the work flow. The main headings do not create problems, but the substructure within the various sections of each Part needs to be aligned with the actual process flow. The proposed AMC5 is confusing, as it was in App. 1 to EU-OPS 1.1045: The table suggests to be a Table of Contents, while it is in fact a list of items to be covered

mixed with instructions on information to be provided. This sub-structure of this table creates a double bind and does not provide a user-friendly layout for a manual structure, since the order/sequence of items to be covered does not correspond human factors. the main chapter structure though is acceptable. Thus the function of AMC5 OR.OPS.015.MLR is not clear: Authorities will use the table of contents as a strict guideline for the structure and content of an Operations Manual. We propose to allow a second option, Option 2.

Making use of modern technology requires format options for Operations Manual

OR.OPS.015.MLR

AMC5 OR.OPS.015.MLR

Replace the Point/AMC/GM on Structure and Content of an Operations Manual by a Point indicating the elements which need to be covered in an OM, with the main chapter titles only.

Do not include into the IRs a binding detailed format of the OM.

Recommend to include in NPA 2009-02 OR.OPS.015.MLR Operations Manual a provision for more than one option in the AMC/GM for the structure of the OM.

Provide as an alternative, at least two options for the provision of documentation for the acceptable means of compliance. Both options must be ICAO Annex 6 compliant.

Option 1: OM format as proposed in the current NPA (AMC5 OR.OPS.015.MLR Operations Manual). Option 1 limits modern economical data processing methods.

Option 2: OM in electronic documentation capable format

Option 2 not only complies with Annex 6, but also with current ATA requirements. Option 2 would assure compliance to a wide number of aviation standards (regulatory and industry), promising considerable synergy gains.

Options 2 would serve the certification requirements for EFBs, for continued airworthiness etc. and enable a cross-functional multi-media approach to provision of information for users, approvers, developers in manufacturing, certification/supervision, operations and training.

Data-integrity and data-security can only be achieved by using the latest standards in communication/information technology.

Within the main titles of the OM-Structure, a more efficient substructure will enhance the ability of any stakeholder to maximise the efficiency of the manual production process. This will reduce costs for the maintenance and exchange/distribution of OM-data/information.

Option 2 enhances the ability to take into account human factors and to make the documentation more user-friendly. User-friendliness needs to be further

studied and defined taking into consideration results from human factors studies and other appropriate scientific tools.

The OM has interfaces to other documentation, which are integrated by using Option 2 (e.g. OM-CAME, OM-(stand-alone)MEL, OM-Security Manual). The complete operator documentation set would benefit greatly from adopting the same (semi-)automated approach.

For EASA and the NAAs there would be minimal differences to the documentation submitted to support an Air Operators compliance as the changes are mainly in the production system.

What would occur is a faster updating of information for new applications and quicker approval of existing operator data.

In light of the current business climate an option for Air Operators to be compliant while using a methodology that offers cost savings and efficiency improvements can only be a great benefit.

As a result of EASA introducing Option 2 into AMC5 OR.OPS.015.MLR (or wherever appropriate in this context), operators would have a much more responsive ability to deliver essential safety information to any stakeholder requiring it. Option 2 also makes easier the electronic communication for the notification of changes to users. Supervision by the operator over OM changes will also be simplified and demand less resources.

The approach recommended with Option 2 is already in force and used extensively for the Initial and Continuing Instructions for Continued Airworthiness and is regarded as industry best practice by Original Equipment Manufacturers and widely used across the airworthiness/manufacturing community, including for the establishment of Flight Manuals and Maintenance Manuals. Operations joining forces with the maintenance community would enhance the interoperability of data and reduce data conflicts and the likelihood of misunderstandings and errors.

Option 2 allows a better use of very expensive information. We know that the maintenance/manufacturing community estimates the cost for one page of technical documentation to be between EUR 500 and EUR 1000 a page. Option 2 allows for easy access to this very valuable information and reduces the life cycle cost for maintaining the documents up-to-date and compliant.

#### **Advantages of Option 2:**

The major advantages would be:

- improved safety,
- possibility to use the advantages of the data base friendly structure of NPA 2009-02 to create (semi-)automated software tools for the establishment and management of manuals
- substantially lower costs for both the industry and certifying/supervising authorities,
- faster updating of essential information and
- lower resource demand and faster deployment of compliance information for users and approval authorities.

Additional advantages of Option 2 would be:

- a more responsive compliance system,
- compliance with an international recognized standard for aviation documentation,
- full integrations with air vehicle and equipment manufacturers' data

production methods,

- information in formats (xml, sgml, pdf, others) for electronic flight bag/e-book readers,
- deployment of current, accurate information to the user at point of use (flight operations, departure planning, training (including recurrent training) and maintenance)
- additional opportunities for air operators to better maintain and sustain a viable business and
- reduced logistics for carrying the required documents on flights.

Disadvantages/Tasks of Option 2:

The single most important step to overcome is for EASA and the approving air operators authority to accept a slightly different format for the proof of compliance documentation.

These variations would be minor but essential. This needs to be implemented in the new regulations.

Paragraph No: AMC5 OR.OPS.015.MLR 9.1.2

Comment: The text does not address the specific requirements for the loading of dry ice and radioactive material.

Justification: Part 7;4.2 of the Technical Instructions requires an operations or other suitable manual to detail a) the maximum quantity of dry ice permitted in each compartment; and b) if radioactive material is to be carried, instructions on the loading of such dangerous goods based on the requirements of 7;2.9 of the Technical Instructions.

Proposed Text (if applicable):

"9.1.2 Guidance on the requirements for acceptance, labelling, handling, stowage and segregation of dangerous goods, including the maximum quantity of dry ice permitted in each compartment and, if radioactive material is to be carried, instructions on loading based on the requirements of Part 7;2.9 of the Technical Instructions "

EASA NPA 2009-02c - **AMC5 OR.OPS.015.MLR - Operations Manual**  
CONTENTS – COMMERCIAL AIR TRANSPORT

The OM should contain the following relevant to the area and type of operation:

...

B AIRCRAFT OPERATING MATTERS – TYPE RELATED

...

4.1 **Performance data** ...

...

h. **Landing field length** (for dry, **wet** and contaminated runway conditions) including the effects of an in-flight failure of a system or device, if it affects the landing distance

...

Comments:

Most aircraft manufactures (Business Aviation) do not present data for the **"actual landing distance" on WET runways!**

**Manufactures should be forced to do so**, already they do present data for actual landing distance on contaminated runways, **and these data should be found in the OM Part B, too.**

For the crew it is important to know the actual landing distance, so they can **determine the actual stop/safety margin** on a given runway! (For example on dry runway, the stop margin for jets on a "standard runway" (ISA conditions, no slope) is at least 66,7%, due to the requirement that the jet can stop within 60% of the available landing distance, assuming no slope and ISA.

On a WET runway, requirements say the available landing distance for jets must be at least 1,917 times as long as the actual landing distance dry(!), which results from the additional factor of 1,15; while the actual landing distance on a WET runway might be much longer than the actual landing distance dry multiplied by 1,15, resulting in a stop/safety margin much less than 66,7%.)

-----  
**Furthermore it is necessary to know the "un-factored" actual landing distance also for a WET runway, if one or more aircraft systems have**

**failed, which would increase the landing distance (e.g. failure to extend flaps, resulting in a higher approach speed and therefore in a longer landing distance).**  
**Now, to enable the crew for a given system failure to apply the applicable factor taken from the abnormal checklist, they must know the "un-factored" actual landing distance; and certainly this applies on a WET runway, too.**

comment 474 comment by: CAA-NL

**Comment CAA-NL:**

It is queried why an operator should have a policy to "ensure security of hazardous material (chemicals, pesticides, fuel, etc.) in field locations".

**Justification:** It is not clear whether the text relates to the operator's property or to cargo. Assuming it is the former there is no corresponding requirement in the Technical Instructions and it does not relate flight safety. Note also that "hazardous material" is an American term and not used in Europe. If it is intended to relate to cargo the Technical Instructions do

contain recommendations concerning only "high consequence" dangerous goods.

**Proposed Text:**

"9.1.1 The operator's policy on the transport of dangerous goods.

comment 586 comment by: *International Air Transport Association*

AMC6 OR.OPS.015.MLR 9.1.1

The term "hazardous material" in this subparagraph is confusing. Generally "hazardous materials" is a term used only in the United States and is synonymous with the term "dangerous goods". However, the context of the wording appears to suggest that it is the term "hazardous substances" that is intended. If this is the case then this should really be in text dealing with worker and workplace safety in the context of occupational health and safety.

comment 587 comment by: *International Air Transport Association*

AMC6 OR.OPS.015.MLR 9.1.2

As commented in AMC5 OR.OPS.015.MLR 9.1.2 the inclusion of the word "labelling" associated with the operator's responsibilities is incorrect. This word should be deleted from 9.1.2.

comment by: *ECA - European Cockpit Association*

Comment on AMC OR.OPS.015.MLR(g): change as follows and transfer to IR:

## AUTHORITY APPROVAL

The operator ~~should~~ **shall** supply the competent authority with intended amendments and revisions **sufficiently** in advance of the effective date, **in order to allow the authority to assess the changes and deliver its approval.** When immediate amendments or revisions are required in the interest of safety, they may be published and applied immediately, provided that the operator also applied for approval at the competent authority. **The operator must immediately inform the personnel affected by the amendment.**

## Justification:

Even when an amendment has not been authorised, the affected personnel by such amendment, must be informed that such amendment is being implemented for safety reasons and that the operator has sought authorisation by the competent Authority.

Furthermore, it is necessary to leave the authority enough time to assess the proposed changes.

Finally, ECA recommends that this provision should be transferred to IR otherwise operators will not be bound to inform any changes to local authorities in advance.

The operator should supply the competent Authority with intended amendments and revisions in advance of the effective date. When immediate amendments or revisions are required in the interest of safety, they may be published and applied immediately, provided that the operator also applied for approval by the competent Authority.

**Comment:**

There should not be a requirement for full approval of the OPS manual. The OM Part-C, which has weekly revisions, should not be approved by the competent Authority, only those major changes but not the smaller changes (i.e. editorials). The OM is anyway under the oversight of the authority, but should not require full approval by the competent authority.

The airlines have in their Ops Manual material not related to the regulation; modification to those parts should not be subject to prior authority approval.

**Proposal:**

Merge AMC OR.OPS.015.MLR(g) Operations Manual - AUTHORITY APPROVAL and AMC OR.OPS.015.MLR(h) Operations Manual- MINOR/MAJOR CHANGES

The resulting text would read as follows:

*The operator should supply the competent Authority with intended amendments and revisions in advance of the effective date. When immediate amendments or revisions **SUBJECT TO AN APPROVAL** are required in the*

interest of safety, they may be published and applied immediately, provided that the operator also applied for approval by the competent Authority

~~MINOR/MAJOR CHANGES REQUIRING APPROVAL~~

~~1-The procedure for minor amendments should be included in the operations manual.~~

~~2-Changes affecting the terms of the certificate as defined in the Operations Specification~~

~~including the following items should be considered as major changes REQUIRING APPROVAL and not be subject to A PRIOR APPROVAL BY THE COMPETENT AUTHORITY the minor amendment procedure:~~

.....

comment

1376

comment by: Pietro Barbagallo ENAC

Comment: This item should be moved at requirements level.

Justification: Any alternative "means of compliance" will be contrary to the notion of approval and can lead to difficulty in the Authority work in running after approval request.

comment

1574 ❖

comment by: The TUI Airlines group represented by Thomson Airways, TUIfly, TUIfly Nordic, CorsairFly, Arkefly, Jet4U, JetairFly

**page 5 OR.OPS.015.MLR(c)**

**Comment:**

**Delete this paragraph.**

Although the wording is copied from JAR-OPS 1.1040(j), the "bindingness" of the IR is different. The operator is responsible for compliance with the regulations, not the competent authority. The inspector, or competent authority, can only flag non-compliances, but has no authority to demand other wording. This is only opening the door for authority interpretation resulting in a non-level playing field

**page 5 OR.OPS.015.MLR (g)(h)**

**page 67 AMC OR.OPS.015.MLH (g) and (h) 1, 2**

**Delete** "minor amendments procedure" entirely.

Matters subject to approval are dealt with, and documented, during the certification process. Requiring the competent authority and its inspectors to approve the OM is counter productive to safety as it will delay the OM and its amendments. Also, it is not in line with the concept of the certificate holder being responsible for compliance.

**Amend** "For air operator certificate holders, the OM and its amendments shall be approved by the competent authority." to "For air operator certificate holders, those parts of the OM and its amendments with are considered major changes, hence subject to prior approval i.a.w. AMC OR.OPS.015.MLR(h)2. shall be approved by the competent authority."

comment by: AIR FRANCE

**Relevant Text:**

The operator should supply the competent Authority with intended amendments and revisions in advance of the effective date. When immediate amendments or revisions are required in the interest of safety, they may be published and applied immediately, provided that the operator also applied for approval by the competent Authority.

**Comment:**

There should not be a requirement for full approval of the OPS manual as explained in the comment about OR.OPS.015.MLR. The OM part submitted for approval to the competent authority should then be limited to those defined as subject to an approval.

**Proposal:**

Merge AMC OR.OPS.015.MLR(g) Operations Manual - AUTHORITY APPROVAL and AMC OR.OPS.015.MLR(h) Operations Manual- MINOR/MAJOR CHANGES

The resulting text would read as follows:

The operator should supply the competent Authority with intended amendments and revisions in advance of the effective date. When immediate amendments or revisions ADD "SUBJECT TO AN APPROVAL" are required in the interest of safety, they may be published and applied immediately, provided that the operator also applied for approval by the competent Authority

DELETE "MINOR/MAJOR" ADD "CHANGES REQUIRING APPROVAL"

DELETE "1 The procedure for minor amendments should be included in the operations manual."

2 Changes affecting the terms of the certificate as defined in the Operations Specification including the following items should be considered as DELETE "major" changes ADD "REQUIRING" DELETE "and not be subject to" A PRIOR APPROVAL BY THE COMPETENT AUTHORITY DELETE "the minor amendment procedure":

comment

3779

comment by: IACA International Air Carrier Association

Delete "minor amendments procedure" entirely.

Matters subject to approval are dealt with, and documented, during the certification process. Requiring the competent authority and its inspectors to approve the OM is counter productive to safety as it will delay the OM and its amendments. Also, it is not in line with the concept of the certificate holder being responsible for compliance.

Amend "For air operator certificate holders, the OM and its amendments shall be approved by the competent authority." to "For air operator certificate holders, those parts of the OM and its amendments with are considered major changes, hence subject to prior approval i.a.w. AMC OR.OPS.015.MLR(h)2. shall be approved by the competent authority."

comment 4023

comment by: *Axel Schwarz*

Not all changes to the Operations Manual require approval. The requirement should read "that the operator also applied for acceptance or approval, as applicable, at the competent authority".

comment by: *CAA-NL*

Comment CAA-NL:

The applicable time scale is set on 90 days from the moment the SOCS has changed the MMEL. In the JAR MMEL/MEL this was changed to 90 days from the moment the SOCS changed the MMEL and to handover to the authority. Experience has learned that if we keep hold on the proposal of the Agency operators will overrun this deadline in most of the time.

comment

1793

comment by: *Austro Control GmbH*

General Comment to relevant AMC:

AMC /GM to OR.OPS.020 expanded to include:

Define three levels of indirect approval:

\*\*\* Administrative (Typos, format error correction, Record new MMEL where no change to MEL

\*\*\* Standard (Add/remove additional A/C to existing MEL, update for MMEL and TGL revisions.

\*\*\* Full (Authority to author and approve new MEL's)

Define the basic concepts of an MEL procedure, and MEL indirect approval procedure.

- Need for input from operations engineering and technical/maintenance engineering personnel.

- Need for a clear two step sign off, covering both areas.

- Need for procedure to be regularly audited by compliance/quality system.

comment 2679 comment by: Airbus

The 90-day time scale for amending the MEL after MMEL change was suitable for a traditional paper document amendment system. It should be discussed whether this time scale is still the right one in an electronic document management environment. Tailored solutions, acceptable to the competent authority, may have to be set up.

Technical comment.

Page 68 AMC2 OR.OPS.020.MLR(c) §2: this § reads "change of a new item...". How a new item can be changed, since it is a new item ? We suggest to delete the word *new*.

Second comment is to say that bullets 2 and 3 are exclusive, so that the "and" at the end of bullet 2 should be replaced by "or". Third comment is to say that bullet 4 has to be deleted ("significant changes to the operational and maintenance procedures"), because the term "significant" is not defined anywhere, and because MMEL operational and maintenance procedures are not approved. Fourth comment is on the concept of Applicable Changes: we propose to introduce the FAA concept of Standard Revision and Interim

Revision. Standard Revision is a revision applicable to all Operators of a type of aeroplane, in that case, the Operator has to amend its MEL accordingly to the MMEL in the 90 days from the date of applicability. Interim Revision is a revision applicable only to Operators impacted by the change(s) introduced in the Interim Revision: it could be the introduction of an optional piece of equipment for example. In that case of Interim Revision, the Operator will not have to inform his competent authority within the 90 days of an Interim Revision.

Technical comment:

Page 68 AMC OR.OPS.020.MLR(d) Format of the MEL: For bullet 1, we suggest that a more flexible approach is taken - no need for specifying a 5 columns format - as new emergent technology such as EFBs may lead to use more appropriate format. For bullet 2, we propose to specify the ATA 100/2200 specifications as an example to keep consistency throughout documentation of equipment designation, as follows: "Designation of equipment should be consistent / homogeneous throughout the documentation to avoid misinterpretation. For example, the ATA 100/2200 Specifications numbering system may be used for the item numbering system".

comment 135 comment by: *Air Via*

It seems the Air Operators have freedom to nominate the person responsible for the control of RIE. The blurred thing here is what kind of training must receive the person in question. Does aeronautical degree, respectively basic Part 66 training satisfy this requirement or any specialised training is necessary? On the second place - "...necessary knowledge in terms of operational use.." - does Part 66 cat.B with at least five years experience in commercial air operator satisfy this? What kind of knowledge of the safety levels criteria.. have to be covered? Does holding of position in Engineering Department of commercial operator for five years is suitable?

comment 165

comment by: ECA - European Cockpit Association

Comment on GM OR.OPS.020.MLR(f): change as follows and transfer to AMC:

**RECTIFICATION INTERVAL EXTENSION (RIE)**

Procedures for the extension of RI should only be applied under certain conditions, such as a shortage of parts from manufacturers or other unforeseen situations (e.g. inability to obtain equipment necessary for proper troubleshooting and repair), in which case the operator may be unable to comply with specified rectification intervals. **The operator must justify these unforeseen circumstances to the Authority.**

Justification:

If the operator doesn't justify these exceptional circumstances there is a risk of an abusive use of the possibility of extending the RI by the operator. ECA recommends these provisions be transferred to AMC as they are required to ensure a safe and reasonable use of RIE.

**C. V. Draft Decision (AMC&GM) Part-OR - Subpart OPS - Section II - AMC  
OR.OPS.025.MLR Operational flight plan - commercial air transport**

p. 69-70

comment 153 comment by: *EHOC*

Paragraph 1.

The Operational Flight Plan is used to document exactly how the flight is to be conducted and what resources will be required: "the operator's plan for the safe conduct of the flight based on considerations of aircraft performance, other operating limitations and expected conditions on the route to be flown and at the aerodromes concerned".

On the other hand, the Journey Log Book is a document that provides a post flight record used to: complete flight records; bill customers; provide the data for engineering schedules etc. In commercial operations, the Technical Log may be used instead of the Journey Log Book.

Because of their disparate uses and the timing of their completion, it would be better to establish the contents of each individually and separately.

comment 353 comment by: *CAA-NL*

Comment regarding:  
EU-OPS & JAR-OPS 3 x.1060

The CAA-NL poses the following question:  
EU-OPS & JAR-OPS 3 x.1060 requires more items to be included in de Operational Flight Plan; why are these requirements not included in this EASA OPS item?

Are these items already in the ATL system?

**C. V. Draft Decision (AMC&GM) Part-OR - Subpart OPS - Section II - AMC  
OR.OPS.030.MLR Information retained on the ground - commercial air  
transport**

p. 70

comment 314 comment by: *ECA - European Cockpit Association*

Comment on paragraph 3: change text as follows:

3 This information includes:

- a. a copy of the operational flight plan, where appropriate;
- b. copies of the relevant part(s) of the aircraft technical log;
- c. route specific NOTAM documentation if specifically edited by the operator;

d. mass and balance documentation; **when mass and balance documentation is sent to aeroplanes via datalink, a copy of the final mass and balance documentation as accepted by the commander must be available on the ground;** and

e. notification of special categories of passenger and special loads including dangerous goods, if applicable.

Comment ref Paragraph 1

This measure is poorly worded and vague and if enacted would not guarantee the new operator the documentation/record but will cost all airlines the administrative resources required to operate it. What record is to be made available - every record on file or a summary or current status and associated check forms?

In drafting this measure, has any thought been given to the issue of language? Records written in Latvian will not be of much use to an Italian Training manager.

Proposal

Comment CAA-NL:  
The 60 days are most of the time too short to review. Please extend this to the 90 days as well

comment 767 comment by: claire.amos

The time scales are a welcome publication of internal policies

comment 1420 comment by: UK CAA

**Page No:** 71

**Paragraph No:** AMC OR.OPS.015.AOC

**Comment:** AMC OR.OPS.015.AOC purports to be a means of compliance. But the rule itself simply requires that an operator must apply for and obtain an AOC prior to commencing commercial air operations. They will comply with that rule whether they apply for and obtain the AOC 90 days or 90 minutes before commencing operations. So this is not a means of compliance at all. It is simply guidance to potential applicants that if they have a start date in mind they should sensibly allow 90 days for the application to be dealt with. It cannot be intended that if someone applies with a target start date in 85 days we need to go through the alternative means of compliance process. If on the other hand the intention is to provide that an authority need not accept an application submitted less than 90 days before the intended start date of the operation, that needs to be a rule (as it is in EU OPS).

comment 1968 comment by: Walter Gessky

**1. AMC OR.OPS.015.AOC Application for an Air Operator Certificate  
APPLICATION TIME FRAMES**

The application for an initial issue of an air operator certificate should be submitted at least 90 days before the date of intended operation. The Operations Manual may be submitted later, but in any case not later than 60 days before the date of intended operation.

Comment:

Request for an application shall be reflected in the rule.

comment 1422 comment by: UK CAA

**Page No:** 75

**Paragraph No:**

AMC1 OR.OPS.210.AOC(a)

**Comment:** AMC 1 OR.OPS.210.AOC(a) states that a person may hold more than one of the nominated posts in certain circumstances. But there is nothing in the rule limiting the holding of more than one post so with what rule is this a means of compliance? The rest of this AMC also appears to be more appropriate as guidance.

It is positive that it is explicitly stated that for a small organization all nominated posts may be filled by the accountable manager but it is unacceptable to require audits conducted by an independent person, since this responsibility lies with the Authority.

This section relates to AOC holders and a similar statement should be made for non-commercial operators and here even more so there should be no requirement for external audits by an independent person. Through the declaration the operator will be subject to oversight from the Authority and this should be sufficient for a non-commercial operator. A requirement for an independent auditor will just drive up the costs.

Non commercial operators have been operating complex aircraft for many years without external supervision and according to EASAs own RIA has a safety record which is superior to that of air taxi operators operating equivalent aircraft. There is therefore no safety case for more costly regulation for this group of operators.

- GM2 OR.OPS.210.AOC (a).
- This section has obviously been written with large organisations and more complex aircraft in mind and is completely inappropriate for most ballooning commercial activities.
- My interpretation of this NPA is that if a pilot receives some form of remuneration to fly a balloon with a sponsors logo on it (even without passengers) then this is a commercial operation and so will require him to be certificated. Are you seriously proposing that he then requires 5 years relevant work experience (clause 2e)? Are you seriously proposing that this same person requires an organisation which can employ its own type rating instructor (clause 4)? Who may not do a similar job for some other organisation with out the express approval of the authority (AMC 1 OR.OPS.210.AOC(a) 4)?
- This is preposterous and should be revised completely to reintroduce some sense of proportionality into the requirements.

comment 3510 comment by: *SAS Scandinavian Airlines*

Paragraph No: OR.OPS.070.FC and AMC.OR.OPS.070.FC

**Comment:**

There does not appear, in the NPA 2009-02C OR.OPS and AMC.OR.OPS, any facility that allows training under an Alternative Training and Qualification Program as is possible in the current EU-OPS 1.978 Alternative Training and Qualification Program.

**Argument:**

EU-OPS is strictly defining the training program, both contents and intervals that Operators must follow for training and checking of Flight Crew. The rules have hardly been changed the last 10 years.

However, new technology, aircraft, navigation equipment, infrastructure and training aids have been continuously developed and this should somehow be included in the training and checking program.

Furthermore have investigations of accidents identified crews lack of skill(s) as a cause, or contributing factor. Studies into the matter are concluding that skill training is the single most important factor in the labour of further improving Flight Safety.

The one and only opportunity addressing these issues under the current regulations is via the EU-OPS 1.978 Alternative Training and Qualification Program.

SAS Scandinavian Airlines started implementing the ATQP 1st July 2008 and are on track for full transition into the ATQP from 1st January 2011. Experience so far is undeniably positive. Administrative tools have been developed enabling mapping of Flight Crew performance during training and checking, as well as in daily operations. These data are used in analyzing the effectiveness of the training program and for training program improvement.

An Operator can via the ATQP administer a wider spectre of training, focusing on specific skills or knowledge that the Flight Crew should master, equalling or increasing the overall Flight Crew performance compared with the performance obtained pre-ATQP. The ATQP enables SAS to fit the training needs of a 50 seat 20T turbo prop aircraft as well as a 260 seat 270T four engine wide body jet transport and optimize time and money spent on expensive Full Flight Simulators. The ability within the ATQP to fit the training needs of different aircraft types makes the ATQP unsurpassed as training and checking program compared to the traditional rule based training and checking program it is complementing.

Early versions of JAR-OPS had provisions for AQP, but lacked guidance for how the program should look like. This may very well be the reason for the European Operators reluctance towards the AQP and early version of the ATQP. Later revisions of JAR-OPS changed the AQP into ATQP and included appendixes, AMC/ACJ and IEM. The Operators now have the means for developing, under the supervision of the authorities, a functioning ATQP and a number of Operators throughout Europe have, and more are in the process.

Training performed under ATQP has a tremendous Safety Benefit to the Operators, as proven in their individual safety cases. The Operator must fulfil strict entry requirements before entering an ATQP, in example a Safety Case, Task Analysis, Feedback Loop and a FDM program. This ensures a standard not less than would be achieved under the requirements of OR.OPS, even when extending the validity periods of some of the requirements of OR.OPS, and replacing some OR.OPS regulated training and checking by valuable operator specific training for crews.

Most of the content in the current EU-OPS will be transported into the new EASA OPS. The Operators must rewrite their Operation Manuals according to the new EASA OPS structure, but the content is more or less the same. In this context is it regrettable that the provisions found in EU-OPS 1.978, according to the NPA is not planned transported into the EASA OPS. However, it seems that the Commission Opinion C(2009)3220 is addressing this shortcoming.

The NPA in its current version is effectively shutting down all ATQP implemented throughout Europe without offering solutions on how such a superior training program can run under the new EASA OPS.

SAS Scandinavian Airlines is therefore suggesting that the ATQP shall be continued as an option for Operators for administering Flight Crew training and checking via transportation of the complete EU-OPS 1.978 text, including appendix, into the EASA OPS.

**Proposed Text** (if applicable):

## OR.OPS.070.FC Alternative Training and Qualification Program

(a) An operator, following a minimum of two years continuous operations, may substitute the training and checking requirements for flight crew specified in OR.OPS by an Alternative Training and Qualification Programme (ATQP) approved by the Competent Authority. The two years continuous operations may be reduced at the discretion of the Competent Authority.

(b) The ATQP must contain training and checking which establishes and maintains a level of proficiency demonstrated to be at least not less than the level of proficiency achieved by following the provisions of OR.OPS. The standard of flight crew training and qualification shall be established prior to the introduction of ATQP; the required ATQP training and qualification standards shall also be specified.

(c) An operator applying for approval to implement an ATQP shall provide the Competent Authority with an implementation plan.

(d) In addition to the checks required by OR.OPS an operator shall ensure that each flight crew member undergoes a Line Orientated Evaluation (LOE).

(1) The Line Orientated Evaluation (LOE) shall be conducted in a simulator. The LOE may be undertaken with other approved ATQP training.

(2) The period of validity of an LOE shall be 12 calendar months, in addition to the remainder of the month of issue. If issued within the final 3 calendar months of validity of a previous LOE the period of validity shall extend from the date of issue until 12 calendar months from the expiry date of that previous LOE.

(e) After 2 years of operating within an approved ATQP an operator may, with the

approval of the Authority, extend the periods of validity as defined in OR.OPS as

follows:

(1) Operator proficiency check - 12 calendar months in addition to the remainder of the month of issue. If issued within the final 3 calendar months of validity of a previous operator proficiency check, the period of validity shall extend from the date of issue until 12 calendar months from the expiry date of that previous operator proficiency check.

(2) Line Check - 24 calendar months in addition to the remainder of the month of issue. If issued within the final 6 calendar months of validity of a previous line check, the period of validity shall extend from the date of issue until 24 calendar months from the expiry date of that previous line check. The line check may be combined with a Line Oriented Quality Evaluation (LOQE) with the approval of the Competent Authority.

(3) Emergency and Safety equipment checking – 24 calendar months in addition to the remainder of the month of issue. If issued within the final 6 calendar months of validity of a previous check, the period of validity shall extend from the date of issue until 24 calendar months from the expiry date of that previous check.

(f) The ATQP shall be the responsibility of a nominated post holder.

## AMC.OR.OPS.070.FC Alternative Training and Qualification Program

(a) An operator's ATQP may apply to the following requirements that relate to training and qualifications:

(1) Low Visibility Operations – Training and Qualifications

(2) Conversion training and checking

(3) Differences training and familiarisation training

- (4) Nomination as commander
- (5) Recurrent training and checking
- (6) Pilot qualification to operate in either pilots seat
- (7) Operation on more than one type or variant

(b) Components of the ATQP - An Alternative Training and Qualification Programme

shall comprise the following:

- (1) Documentation that details the scope and requirements of the programme;
- (2) A task analysis to determine the tasks to be analysed in terms of:
  - (i) knowledge;
  - (ii) the required skills;
  - (iii) the associated skill based training; and
  - (iv) where appropriate, the validated behavioural markers.
- (3) Curricula – the curriculum structure and content shall be determined by task analysis, and shall include proficiency objectives including when and how those objectives shall be met. The process for curriculum development shall be acceptable to the Competent Authority;
- (4) A specific training programme for:
  - (i) each aeroplane type/class within the ATQP;
  - (ii) the instructors (Class rating instructor rating/Synthetic flight instructor authorisation/Type rating instructor rating - CRI/SFI/TRI), and other personnel undertaking flight crew instruction;
  - (iii) the examiners (Class rating examiner/Synthetic flight examiner/Type rating examiner - CRE/SFE/TRE); to include a method for the standardisation of the instructors and examiners;
- (5) A feedback loop for the purpose of curriculum validation and refinement, and to ascertain that the programme meets its proficiency objectives;
- (6) A method for the assessment of flight crew both during conversion and recurrent training and checking. The assessment process shall include event-based assessment as part of the LOE. The method of assessment shall comply with the provisions of OR.OPS;
- (7) An integrated system of quality control, that ensures compliance with all the requirements, processes and procedures of the programme;
- (8) A process that describes the method to be used if the monitoring and evaluation programmes do not ensure compliance with the established proficiency and qualification standards for flight crew; and
- (9) A Data Monitoring/Analysis programme.

(c) Implementation - The operator shall develop an evaluation and implementation strategy acceptable to the Authority; the following requirements shall be fulfilled:

- (1) The implementation process shall include the following stages:
  - (i) A safety case that substantiates the validity of:
    - (A) The revised training and qualification standards when compared with the standards achieved under OR.OPS prior to the introduction of ATQP.
    - (B) Any new training methods implemented as part of ATQP.
 If approved by the Competent Authority the operator may establish an equivalent method other than a formal safety case.
  - (ii) Undertake a task analysis as required by paragraph (b)(2) above in order to establish the operator's programme of targeted training and the associated training objectives;
  - (iii) A period of operation whilst data is collected and analysed to ensure the efficacy of the safety case or equivalent and validate the task analysis. During this period the operator shall continue to operate to the pre-ATQP OR.OPS requirements. The length of this period shall be agreed with the Competent Authority;

(2) The operator may then be approved to conduct training and qualification as specified under the ATQP.

If the proposed text to an OR.OPS.070.FC Alternative Training and Qualification Program and AMC.OR.OPS.070.FC Alternative Training and Qualification Program is not feasible, SAS Scandinavian Airlines would like two things:

- An EASA defined ATQP structure
- An ability to vary the validity periods of the OPC, Line Check and Emergency/Safety Checks as per EU-OPS 1.978 Alternative Training and Qualification Program

SAS Scandinavian Airlines do not want to lose the benefits the company has gained by implementing the EU-OPS ATQP. The ability to vary the periods of validity is fundamental to this. SAS Scandinavian Airlines is also concerned that the only way to achieve an ATQP under EASA OPS is by an Alternative Means of Compliance.

SAS Scandinavian Airlines is sincerely hoping that EASA will consider this comment thoroughly. Training under ATQP is superior to traditional training and SAS Scandinavian Airlines would like to exploit the opportunities in the program further, not abandon the ATQP as the NPA is suggesting.

comment by: Rega / Swiss Air-Ambulance

**AMC OR.OPS.015.FC (d) Composition of flight crew**

**Preface:**

It is the opinion of Swiss Air Ambulance that the proposed paragraph AMC OR.OPS.015.FC (d) 1 for "relieving the pilot-in-command" is influenced by unknown unions who try with the under the above mentioned NPA paragraph to upgrade more co-pilots to pilots-in-command.

Beside Swiss Air Ambulance hundreds of airlines and corporate operators within Europe and worldwide established during the past decades safe and well respected procedures as proposed/commented below for the relieve of the pilot-in-command by experienced co-pilots.

**Scope:**

Relieving of flight crew members above Flight Level (FL) 200.

**Text to be added/altered:**

IN-FLIGHT RELIEF OF FLIGHT CREW MEMBERS - AEROPLANES

A flight crew member should be considered suitably qualified to relieve another flight crew member of his duties at the controls in flight in the following cases:

1. The pilot-in-command may delegate the conduct of the flight to another qualified pilot **above FL200** provided the relieving **pilot:**

a. holds the appropriate type or class rating;

b. meets the applicable recent experience requirements for **pilots as specified in FCL.060 (b)(1)**

**c. holds a valid Airline Transport Pilot Licence**

**d. has the route competence qualification according O R.OPS.020.FC (b)(2)(ii)**

**e. meets any other requirements which the operator may have established for that purpose.**

**Proof:**

The under the existing NPA "AMC OR.OPS.015.FC (d) Composition of flight crew" proposed text allows only a pilot-in-command to relieve another pilot-in-command and will -with no gain in safety- jeopardize the continuity of Swiss Air Ambulance's jet Aeroplane Emergency Medical Service (AEMS) operations.  
Reason:

- It is economically not bearable to upgrade all co-pilots to pilots-in-command to relieve other pilots-in-command

**Background:**

Swiss Air Ambulance is a subsidiary of Rega, Switzerland's national air-rescue organisation, which was founded in 1952. Swiss Air Ambulance can draw on decades of experience and the expertise of professional teams to provide competent, comprehensive assistance in the event of medical emergencies all over the world operating besides 13 dedicated HEMS helicopters 3 dedicated Bombardier CL-604 "Challenger" ambulance jets with a range of 3'500 NM. Its services range from providing medical advice to repatriating patients to/from Switzerland or any other point of the world. Swiss air-ambulance is a private, non-profit organisation, which operates in accordance with the guiding principles of the Red Cross. It comes to the aid of people in distress, without respect of their nationality, religious convections or social status. Swiss air-ambulance operates under the Air Operator Certificate CH-AOC-No.1015 issued by the Federal Office of Civil Aviation Switzerland (FOCA) and is compliant with EU-OPS. Comment on AMC OR.OPS.015.FC (d)(4): change as follows:

4 A ~~system panel operator~~ **flight engineer** may be relieved in flight by a crew member suitably qualified in accordance with applicable national rules.

Justification:

The title flight engineer is used in other parts of OR-OPS.

There is no such thing as a System panel operator station or license.

**Section:**

OR.OPS.020. Designation as Pilot-in-Command  
and

AMC.OR.OPS.015 FC (d) Composition of flight crew (In-Flight Relief of Flight Crew Members)

**Relevant Text:**

AMC OR.OPS.015.FC (d) Composition of flight crew

INFLIGHT RELIEF OF FLIGHT CREW MEMBERS AEROPLANES

A flight crew member should be considered suitably qualified to relieve another flight crew member of his duties at the controls in flight in the following cases:

1 The pilot in command

may delegate the conduct of the flight to another qualified pilot provided the relieving pilot in command:

- a. holds the appropriate type or class rating;
- b. meets the applicable recent experience requirements for pilots in command as specified in FCL.060;
- c. meets the relevant qualifications prescribed in OR.OPS.020.FC, such as minimum level of experience, command course, competence regarding area, route, aerodrome, facilities and procedures; and
- d. meets any other requirements which the operator may have established for that purpose.

And from OR.OPS.020.FC to which it refers in sub para (c):

OR.OPS.020.FC Designation as pilot in command

(a) One pilot amongst the flight crew shall be designated by the operator as pilot in command:

(b) The operator shall only designate a flight crew member to act as pilot in command:

if

he/she:

(1) complies with the minimum level of experience specified in the Operations Manual;

(2) except in the case of balloons:

(i) has adequate knowledge of the route or area to be flown and of the aerodromes, facilities and procedures to be used;

(ii) in the case of commercial operations, has had experience within the last 12 months of the route or area to be flown and of the aerodromes, facilities and procedures to be used;

(3) in the case of multicrew

operations, has completed a command course provided by the operator, as specified in the Operations Manual;

**Comment:**

The requirement in OR.OPS.020.FC (3) (to have completed a command course) is far more restrictive than the corresponding EU-OPS paragraph on in-flight relief of flight crew members which allows the PIC to be relieved by another suitable qualified flight crew member which does not need to be a Commander above FL200.

This EASA proposal, which is not line with EU-OPS. neglects decades of safe operations based on the existing rules. It has no safety justification and would lead to an unacceptable increase in crew cost. It will lead to business shifting to non-EU airlines.

**Proposal:**

Realign the in-flight relief requirements for flight crew with the provisions of EU-OPS (Appendix 1 to EU-OPS.1.940) through a simple copy and paste of the EU-OPS provisions into the corresponding EASA Implementing Rules

**Relevant Text:**

c. meets the relevant qualifications prescribed in OR.OPS.020.FC, such as minimum level of experience, command course, competence regarding area, route, aerodrome, facilities and procedures; and

**Comment:**

The requirement for a command course does imply the need for multiple commanders on every flight. E.g. long haul flights forced to be operated with multiple commanders only i.s.o one commander and two first officers.

Current EU-OPS rules are less demanding.

Under the current system of the EU-OPS there's a possibility to relieve a function above FL200 with less demanding qualifications. The current system has been used for many years and there's no evidence that this poses a safety risk.

The Basic Regulation (BR) allows for issuing a limited licence, including limited training and checking;

- Basic Regulation (BR) Article 7 gives room for pilot with a limitation, translated into FCL.015
- BR) Annex III, Article 1d Practical skill explicitly states; if appropriate to the functions exercised on the aircraft
- BR) Annex III, Article 1.e explicitly states; appropriate to the functions exercised on the aircraft

**Proposal:**

Revert to EU-OPS principle where a Rating and ATPL was required to relieve the commander.

Delete command course requirement.

**NPA 2009-02c, Part OR (Subpart OPS)**

AMC.OR.OPS.015.FC(d), Composition of flight crew

Para 1.

Page 77 of 136

**BOEING COMMENT:**

By specifying that a flight crew member needs to meet the requirements of sub-paragraphs 1.a. through 1.d. of this section, it appears that the Agency will require operators to have in-flight relief for the Pilot-in-Command only by another Captain. We recommend that this be eliminated, and replaced with wording consistent with current requirements in EU-OPS.

**JUSTIFICATION:** As worded in the NPA text, this exceeds current requirements, has no safety justification, and will have a huge impact on costs for community operators.

comment by: *British Airways Flight Operations***Relevant Text:**

AMC OR.OPS.015.FC (d) Composition of flight crew

INFLIGHT RELIEF OF FLIGHT CREW MEMBERS AEROPLANES

A flight crew member should be considered suitably qualified to relieve another flight crew

member of his duties at the controls in flight in the following cases:

1 The pilot in command

may delegate the conduct of the flight to another qualified

pilot provided the relieving pilot in command:

- a. holds the appropriate type or class rating;
- b. meets the applicable recent experience requirements for pilots in command as specified in FCL.060;
- c. meets the relevant qualifications prescribed in OR.OPS.020.FC, such as minimum level of experience, command course, competence regarding area, route, aerodrome, facilities and procedures; and
- d. meets any other requirements which the operator may have established for that purpose.

And from OR.OPS.020.FC to which it refers in sub para (c):

OR.OPS.020.FC Designation as pilot in command

(a) One pilot amongst the flight crew shall be designated by the operator as pilot in command:

(b) The operator shall only designate a flight crew member to act as pilot in command:

if

he/she:

(1) complies with the minimum level of experience specified in the Operations Manual;

(2) except in the case of balloons:

(i) has adequate knowledge of the route or area to be flown and of the aerodromes, facilities and procedures to be used;

(ii) in the case of commercial operations, has had experience within the last 12 months of the route or area to be flown and of the aerodromes, facilities and procedures to be used;

(3) in the case of multicrew

operations, has completed a command course provided

by the operator, as specified in the Operations Manual;

**Comment:**

The requirement in OR.OPS.020.FC (3) (to have completed a command course) is far more restrictive than the corresponding EU-OPS paragraph on in-flight relief of flight crew members, which allows the PIC to be relieved by another suitably-qualified flight crew member (who does not need to be a Commander) above FL200. Generally, the only pilots who have completed command courses are captains. This proposal would seem to imply that command courses will be

more widely required, which is unacceptable.

This EASA proposal, which is not line with EU-OPS. neglects decades of safe operations based on the existing rules. It has no safety justification and would lead to an unacceptable increase in crew cost. It will lead to business shifting to non-EU airlines.

**Proposal:**

Realign the in-flight relief requirements for flight crew with the provisions of EU-OPS (Appendix 1 to EU-OPS.1.940) through a simple copy and paste of the EU-OPS provisions into the corresponding EASA Implementing Rules

**General Comment:**

NPA 2009-2 in its entirety is unfit for the purpose for which it is intended and must be withdrawn and reconsidered.

**European Regions Airline Association Comment**

OPS 1.978 and its Appendix 1 describe the way an Alternative Training and Qualification Program (ATQP) can be approved. They are the result of extensive discussions in the past.

EASA has not reproduced this article nor its Appendix on the grounds of the "built-in" possibility to change any AMC.

ERA acknowledge such possibility, however, the wording of 1.978 and its Appendix could usefully be reproduced in GM as an indication on how to have an AMC approved on that subject. Such incorporation would avoid losing track of OPS 1.978 and its Appendix

comment

3205

comment by: DGAC

**(1)(c) :**

The PIC can only delegate to a PIC, including above FL200. This, besides making a huge difference from the provisions contained in EU-OPS though EASA had proclaimed that there would only be differences in the structure, not in the content of the rules applicable to CAT, raises unanswered questions :

- Who has the legal responsibility on board between the two captains?
- Why is it necessary to have a second captain when a co pilot can perform the job?
- Why is this important information shrouded in an AMC?

**Paragraph No:**

AMC OR.OPS.015.FC (d) 4

**Comment:**

The term "system panel operator" is not defined but is assumed to mean a

qualified pilot trained to operate the panel and is required where the Flight Manual specifies three pilots. A Flight Engineer requires a separate and specific licence and is required when the Flight Manual specifies two pilots and a flight engineer. The term "Flight Engineer" is recognised and used in OR.OPS.025.FC but has no supporting guidance as this is delegated to the National Authority. "System panel operator" is used extensively throughout the AMC material in this NPA but not referenced within the Implementation Rules.

Clarification is required to differentiate between the two terms.

**Justification:**

Consistency through the document.

**Proposed Text (if applicable):** Include an additional paragraph in the rule, similar to that for the Flight Engineer, delegating requirements to the National Authority. Delete the guidance and AMC's relating to the System Panel Operator.

1.  
IACA suggests to change the wording of the introductory sentence of paragraph 1 as follows:  
The pilot-in-command may delegate the conduct of the flight to another qualified pilot provided that the relieving pilot: ...."  
Reason: only one pilot-in-command on board, the relieving pilot will not function as PIC.

comment 3802 comment by: *IACA International Air Carrier Association*

1.  
The AMC should clarify that there is only one pilot-in-command, who retains the final decision during the entire flight, even while relieved by another pilot (e.g. cruise relief captain) for the conduct of the flight.  
The pilot-in-command status is not related to pilot-flying/pilot-non-flying, but identifies the flight crew member as being the "final authority" on board.

comment 3104

comment by: ERA

**European Regions Airline Association Comment**

The provisions in 3 b – requiring a visit or simulator training , presumably at 12 months intervals – are particularly difficult for operators to comply with, because it reduces flexibility and carries additional costs without a direct safety value added. This is because that such a visit every 12 months does not necessarily provide the pilot-in-command with the knowledge and skills to operate at airports that require additional considerations under circumstances other than those actually encountered during the visit. The industry had earlier raised this issue vis-à-vis JAA, suggesting that programmed instruction may fulfil the requirement.

An alternative for operators would be to categorize all aerodromes that do not qualify as category A, as category B aerodromes. This would not formally constitute lack of compliance inasmuch as 'additional considerations' for category C aerodromes are not defined. However, from an operational perspective it does make good sense to have a category for the most challenging aerodromes. It should, however, be possible for an operator to establish an alternative means of compliance for currency for pilots-in-command for such aerodromes. One system that could be employed would include an explicit scheme for assessment of relative difficulty of operation, for example with basis in FSF CFIT checklist. Based on the risk factor, the aerodromes are categorized, possibly with higher differentiation than categories A, B and C. An operator may also want to specify and define the 'additional considerations' that require special release. An operator may introduce programmed instruction in the form of aerodrome briefing pages or CBT multimedia briefings, as well as simulator training which may be of a generic nature for types of operation that are unique to a subset of the most difficult aerodromes, e.g. increased bank during climb-out. An operator may require a visit for initial release, and programmed instruction for recurrency.

It is therefore suggested that AMC OR.OPS.020 FC(b)(2) either be presented as GM instead of AMC, or that the AMC is reworded, or that the AMC is supplemented by an AMC2. Specifically, the following is proposed:

Current AMC is reclassified as GM

Current AMC is amended as follows:

3 b: (Prior to operating to) a Category C aerodrome, the pilot-in-command should be briefed, or self-briefed, by means of programmed instruction, including CBT detailing the operating characteristics of that particular aerodrome. If possible, this may be supplemented by a visit to the aerodrome under supervision of a check pilot or instructor pilot, or instruction in a Flight Simulator. The briefing, and visit and/or simulator training when applicable, should be recorded.

Current AMC is renamed AMC1 and a new AMC2 is introduced as follows:  
 Verbatim identical up to 2.  
 New 2 as follows:

2.1 Aerodrome competence training should include knowledge of obstructions, physical layout, lighting, approach aids and arrival, departure, holding and instrument approach procedures and applicable minima. Where special weather phenomena, including turbulence, and/or special operating procedures for approach and/or climb out, are relevant, such items should be covered.

2.2 The Operations Manual should describe a method for assessment of the relative risk of approach and departure operations of aerodromes that do not comply with the following:

- (insert current 2.3.1).

For those aerodromes not in compliance with 2.3.1 above, the Operations Manual should describe the methods of initial qualification and recurrent qualification for the pilot-in-command to operate to and from such aerodromes.

<b>C. V. Draft Decision (AMC&amp;GM) Part-OR - Subpart OPS - Section V - Chapter 1 - AMC OR.OPS.050.FC Pilot qualification to operate in either pilot's seat</b>	p. 79-80
--	----------

comment 660

comment by: AEA

**Relevant Text:**

1. Pilot-in-command whose duties require them to operate in either seat...
- ..
5. A pilot other than the pilot-in-command occupying the pilot in command seat...

**Comment:**

Training is only related to take off and landing. Therefore this AMC does not provide for legal certainty.

The terminology 'pilot in command seat' is not defined.

**Proposal:**

Add 'below FL200' to point 1 and point 5.

comment 672

comment by: Bristow Helicopters

**Comment** In paragraph 1.1, the requirement to complete the type rating proficiency check from the normally occupied seat is restrictive and unnecessary. Helicopter pilots-in-command who operate from both seats will undergo proficiency checks in alternate seats under the requirements of this paragraph. It does not matter whether the proficiency check is for the type rating or operator check, since the content of each check is almost identical. Also there appears to be no definition of "normally occupied" seat. It could be interpreted as the command seat (generally RHS in helicopters), or the seat most frequently occupied, which will depend on the nature of the operation. What is the intention of this requirement?

**Proposed Amendment**

1.1 In the case of helicopters, these pilots should also complete their proficiency checks respectively from left and right hand seats, on alternate proficiency checks, ~~provided that when the type rating proficiency check is combined with the operator proficiency check the pilot-in-command completes his/her training or checking from the normally occupied seat.~~

**Justification** Part FCL allows the type skill test/proficiency check for a multi-pilot helicopter to be conducted in either seat.

Consider changing the title "Pilot Not Flying" to "Pilot Monitoring" in Paragraph 5

The term "PILOT MONITORING", proposed by the Flight Safety Foundation as well as the actual CRM worldwide forums, including Threat and error management, describes what the pilot should be doing (monitoring) versus what she/he is not doing (not flying). A negative concept, with a passivity and inactivity meaning, is replaced by a new concept that states a fundamental task for the safety of the operation. Thus, the flight crew would be composed of the pilots that fly the aircraft (Pilot Flying) and the pilot that monitors the pilot that is flying (Pilot Monitoring).

**Comment:**

The wording of the opening for the helicopter paragraph is different to that of the aeroplane. For consistency it should be the same where possible.

**Justification:**

Consistency of text.

**Proposed Text (if applicable):** Amend paragraph 2 to read:

"A lesser number of flight hours, on the type and/or in the role, *and subject to any other conditions which the competent authority may impose, may be acceptable to the competent authority when*" and the words "may be considered if" should be deleted.

**C. V. Draft Decision (AMC&GM) Part-OR - Subpart OPS - Section V - Chapter 2 - AMC OR.OPS.030.FC and OR.OPS.130.FC Crew Resource Management (CRM)** p. 80-85

comment	<p>155 <span style="float: right;">comment by: EHOC</span></p> <p><u>Paragraph 3.</u></p> <p>Editorial: Formatting.</p>
comment	<p>169 <span style="float: right;">comment by: ECA - European Cockpit Association</span></p> <p>Comment on AMC OR.OPS.030.FC and OR.OPS.130.FC(8): change as follows:</p> <p>8 Assessment of CRM Skills</p> <p>8.1 Assessment of CRM skills is the process of observing, recording, interpreting and debriefing crews' and crew member's performance and knowledge using an acceptable methodology in the context of overall performance. It includes the concept of selfcritique, and feedback which can be given continuously during training or in summary following a check. In order to enhance the effectiveness of the programme this methodology should, <del>where possible,</del> be agreed with flight crew representatives.</p> <p>Justification:</p> <p>It is essential the participation of the flight crew representatives in the programme so that flight crew members can gain confidence in the process.</p>
comment	<p>1453 <span style="float: right;">comment by: Pietro Barbagallo ENAC</span></p> <p>Comment:1.3 Should be amended as follows:....reflect the culture and kind of operations of the operator</p> <p>Justification: 1.3 In these years the kind of operations, including aircraft type used by the operators has been too often not taken into account producing ineffective CRM training delivered to bored pilots (e.g. large airline cases presented to helicopter pilots).</p>
comment	<p>1454 <span style="float: right;">comment by: Pietro Barbagallo ENAC</span></p> <p>Comment: 2.2 To be moved in 1 General to become 1.6 and changed as follows. A CRM trainer should at least: have completed a basic instructional technique course including education and interactive skills, have commercial experience as a flight crew member, have successfully passed a human performance and limitation exam, have completed initial CRM training, have theoretical experience on the subject of CRM or HF training. He/she shall demonstrate: 1) to have the knowledge specific to each kind of CRM training/assessment to be conducted;2) to have the necessary instructional skills; 3) to be able to facilitate crew member CRM skills and assess the performance in a constructive way according to the following point 8." Assessment of CRM skills". This demonstration should be given to an experienced CRM trainer suitably qualified as determined by the Authority.</p> <p>Justification:The qualification of a CRM trainer has not to be limited to Initial CRM as it is now, but applies to all kind of CRM with variants related to the content of the training and the environment of the training (classroom, simulator, flight, initial, type, operator's, recurrent training and so on) but not to the competent behaviours that he shall use. Many surveys carried out in these years have demonstrated that having commercial flight experience as crew member is not a guarantee of effectiveness without appropriate training but is essential for face validity and practical value of CRM training. The proposed elements of competence are more easily and objectively measured</p>

than the existing ones that are included anyway. To leave to the Authorities to determine the level of experience and qualification that a CRM supervisor shall have, gives a fair amount of flexibility for the different cultures and national situations

comment 1455 comment by: *Pietro Barbagallo ENAC*

Comment: 2.3 Should be moved into the following 3. "Operator conversion course" after point 3.2. Substitute ...initial CRM... with An operator should ensure that Conversion course CRM training.....  
Justification: Initial CRM has a general scope. Operator's Conversion Course CRM should include all the elements of 2.3.

comment 1456 comment by: *Pietro Barbagallo ENAC*

Comment: 2.4 Should be moved into 1 General to become 1.7. The content of the first line.....to establish initial CRM training... should be changed into "to establish CRM training".  
Justification: Many small operators don't have the resources and competence to do any CRM training in classroom. For simulators the use mostly Providers. It is not just an Initial CRM problem.

comment 1457 comment by: *Pietro Barbagallo ENAC*

Comment: 5.1.b Should be deleted if CRM competence and supervision are included in point 1. General  
Justification: CRM Trainer competence and qualifications are a general issue for all CRM training, not just RT.

comment 1458 comment by: *Pietro Barbagallo ENAC*

Comment: 6.1 Table: Recurrent Training vs Case based studies, to be changed from as appropriate to In depth or Required  
Justification: As appropriate is a too ambiguous term. Case based studies as identified by the accident prevention program and management system are the main part of the inputs to identify areas which warrant extra attention during CRM RT revision that shall take place over a period not exceeding 3 years. Thus can't be addressed without proper attention to keep coherence with AMC1 OR.OPS.145.FC and also AMC2 OR.OPS.115.CC page 105

comment 1459 comment by: *Pietro Barbagallo ENAC*

Comment: 8.7 Should be changed into.....the required CRM standards  
Justification: Need some specification as this principle applies to all situations in which personnel do not achieve or maintain adequate standards. The specification is useful because it doesn't imply that this training is only given after a failed check.

comment 2160 comment by: *Ryanair*

1.1 Comment

The The direction to complete Initial CRM "outside the operator premises", albeit "whenever possible" is very restrictive. Large ATO's and Operator's will

have excellent training facilities on a site owned and operated by the ATO or Organisation. These should not be precluded as a location for CRM training.

PrPPproposal: -

**1.1 AMC OR.OPS.030.FC and OR.OPS.130.FC Crew Resource Management (CRM) – Page 81**

1.5 It is recommended that, whenever possible, initial CRM training be conducted in a group session outside the operator's premises **or at a recognized training centre** so that the opportunity is provided for flight crew members to interact and communicate away from the pressures of their usual working environment **training is the goal.**

comment

2194

comment by: Ryanair

**Comment**

1. This AMC appears to rule out existing CRM instructors who were not aircrew but who have been found to be acceptable by the Authority. Is it EASA's intention to remove any existing approvals for such instructors when this NPA is enacted fully?
1. Within the proposed the following change should be made to make the role of CRM instructor open to flight crew who have been declared medically unfit to fly or who have reached a certain age. For example, this text would appear to exclude an SFI from being a CRM Instructor: -
  1. Have had and maintain adequate knowledge of the operation and the aircraft type, preferable through current or past relevant commercial air transport experience as a flight crew member:

comment

3046

comment by: CRM Advisory Panel to the United Kingdom Civil Aviation Authority

**Comment:**

An individual without commercial aircrew experience should only be able to become, or continue to be a CRM instructor, but only if they can demonstrate to the National Authority that they have the necessary instructional and facilitational skills, sufficient knowledge of the operation and flight deck environment, and the credibility to be able to train all of the Pilot CRM Training syllabus to the same standard as a CRM Instructor with Commercial Flightdeck experience.

Proposal:

Ammend 2.2 and add new 2.3 with the following:

2.2 A CRM Trainer should:

- a) Have completed a basic instructional technique course acceptable to the National Authority
- b) Have or have had commercial air transport experience as a flight crew member;

c) Have successfully passed the Human Performance and Limitations (HPL) examination whilst recently obtaining the ATPL in accordance with Part FCL; or followed a theoretical HPL course covering the whole syllabus of the HPL examination;

d) Have completed initial CRM training;

e) Have received additional education in the fields of group management, group dynamics and personal awareness;

f) Have demonstrated to the National Authority that they have the necessary knowledge and instructional skills;

g) Be supervised by suitably qualified CRM during their first initial CRM training sessions.

2.3 In addition, and when acceptable to the National Authority a flight-crew member may become or continue to be a CRM Trainer after the cessation of active flying duties provided they maintain adequate knowledge of the operation and aircraft type. A non flight-crew member may also be or become a CRM Trainer, provided they are able to demonstrate to the National Authority that they have the required operational knowledge, instruction and facilitation skills, and the credibility required to be able to train all areas of the flight crew CRM syllabus to the required standard.

Methodology should be agreed with Flight Crew reps. We suggest that this should be 'best practice' rather than legal requirement.

comment

3822

comment by: Ryanair

COmment Ref 7.2

This requirement to have cabin and flight crew CRM instructors observe each other and comment on each other's style is completely impractical and must be

removed. In large organisations where CRM training takes place in many diverse locations it is simply not possible to arrange this without significant cost and inefficiencies. Large organisations have hundreds of CRM instructors.

It is the task of training managers to oversee the activities of instructors and to unify their style and method. Once provision for **THIS** is in place the function is catered for.

Proposal

7.2 There should be an effective liaison between flight crew and cabin/technical crew training departments. Provision should be made for training managers to observe and comment on CRM instructors training.

**C. V. Draft Decision (AMC&GM) Part-OR - Subpart OPS - Section V - Chapter 2 - AMC1 OR.OPS.135.FC Operator conversion training and checking** p. 85-87

comment

294

comment by: ECA - European Cockpit Association

Comment on AMC1 OR.OPS.135.FC 1.1: change as follows and transfer to IR:

1 General

1.1 The operator conversion training should include, in the following order:

- a. Ground training and checking, including aircraft systems, and normal, abnormal and emergency procedures;
- b. Emergency and safety equipment training and checking, (completed before **line flying under supervision if an FSTD is used or before** flying training **in the aircraft** commences);
- c. Flying training and checking (aircraft and/or flight simulator);
- d. Line flying under supervision and line check; and
- ~~e. When a flight crew member has not previously completed an operator's conversion course, general first aid training and, if applicable, ditching procedures training using the equipment in water.~~

Justification:

This provision was at section 1 level in EU OPS.

Furthermore, point e) may be performed after b). Imposing e) to be performed at last is uselessly burdensome and requiring, and not compliant with EU OPS contents.

comment

295

comment by: ECA - European Cockpit Association

Comment on AMC1 OR.OPS.135.FC 4:

Add paragraph 4.5 as follows :

4.5 In the case of a ZFTT course, this training should include a specific simulator session during which includes six take-offs and landings, not later than 21 days after the completion of the skill test.

This simulator session shall be conducted by a type rating instructor for aeroplanes (TRI(A)) occupying a pilot's seat.

When recommended by a JOINT OPERATIONAL EVALUATION Board (JOEB) and approved by the Authority, the number of take-offs and landings may be reduced.

If these take-offs and landings have not been performed within the 21 days, the operator shall provide refresher training acceptable to the competent

Authority;

Justification:

This was the EU OPS requirement for ZFTT.

comment

419

comment by: CAA-NL

Comment regarding:

4.4 Unless the type rating training programme has been carried out in a Flight Simulator

usable for zero flighttime

training (ZFTT), the training should include at least 3 takeoffs and landings in the aircraft.

Comment CAA-NL:

Number of landing is not correct.

Reason:

Not in Line with FCL: For multi-pilot aeroplanes where the student pilot has more than 500 hours MPA experience in aeroplanes of similar size and performance, these should include at least 4 landings of which at least one should be a full stop landing. In all other cases the student should complete at least 6 landings.

comment

420

comment by: CAA-NL

Comment regarding:

b. Aeromedical topics including:

6 Passenger handling. Other than general training on dealing with people, emphasis

should be placed on the following:

7 Discipline and responsibilities. Amongst other subjects, emphasis should be placed

on discipline and an individual's responsibilities in relation to:

8 Passenger briefing/safety demonstrations. Training should be given in the preparation of passengers for normal and emergency situations.

Comment CAa-NL:

is not in line with EU-OPS or section 2 material OPS-1.

New topics are introduced.

These new topics should be presented via a separate new NPA in a later stage.

comment

476

comment by: CAA-NL

### **Regarding 6c**

**Comment CAA-NL:** The text appears to require dangerous goods training as part of type conversion training and assumes that some dangerous goods may be allowed in the cabin depending on the type.

**Justification:** Dangerous goods are either allowed in the cabin (as a permitted item of passenger baggage), or they are forbidden. The type of aircraft has no bearing on this and so if personnel still hold a valid dangerous goods training qualification no further training is required.

**Proposed Text (if applicable):**

Delete AMC1 OR.OPS.135.FC 6 c. and consequentially re-number subsequent paragraphs

comment 589 comment by: *International Air Transport Association*

AMC1 OR.OPS.135.FC 6 c.

The text of this subparagraph implies that some element of dangerous goods training must be provided to flight crew as part of any type conversion training. Initial and recurrent dangerous goods training must be provided to flight crew in accordance with the provisions of the ICAO Technical Instructions and must include more information than is indicated in this subparagraph and may not be required at the time of any type conversion training dependant on the last training date.

Proposed amendment. Delete subparagraph c and renumber subsequent subparagraphs accordingly.

comment 872 comment by: *ECA - European Cockpit Association*

Comment on AMC1 OR.OPS.135.FC 1.1: Restructure the whole paragraph in order to establish a logical sequence.

First ground training which may be combined with sim training; then flight training; E&SET before or after flight training, depending on the use of A/C or sim; then line flying under supervision, then line check.

**Justification:**

The sequence of the training elements cannot be established as an optional way to train, as an AMC implies. Several elements may be combined, like ground training and simulator training; other elements clearly need a logical sequence; e.g if no simulator is used, flight training must follow ground training. This AMC is (in its shortness) inappropriate.

comment 900 comment by: *ECA - European Cockpit Association*

Comment on AMC1 OR.OPS.135.FC:

Operator conversion training and checking; upgrade text from App 1 1.965 to IR

**Justification:**

Downgrading to AMC is not acceptable

comment 904 comment by: *Federal Office of Civil Aviation (FOCA), Switzerland*

**Concern Detail:**

The text appears to require dangerous goods training as part of type conversion training and assumes that some dangerous goods may be allowed in the cabin depending on the type.

**Comment:**

Dangerous goods are either allowed in the cabin (as a permitted item of passenger baggage), or they are forbidden. The type of aircraft has no bearing on this and so if personnel still hold a valid dangerous goods training

qualification no further training is required.

**Proposal:**

Delete AMC1 OR.OPS.135.FC 6 c. and consequentially re-number subsequent paragraphs.

6 Passenger handling. Other than general training on dealing with people, emphasis should be placed on the following:

- a. Advice on the recognition and management of passengers who appear or become intoxicated with alcohol, under the influence of drugs or aggressive;
- b. Methods used to motivate passengers and the crowd control necessary to expedite an aircraft evacuation;
- c. Awareness of the types of dangerous goods which may, and may not, be carried in a passenger cabin, including the completion of a dangerous goods training programme; and
- d. The importance of correct seat allocation with reference to aircraft mass and balance. Particular emphasis should also be given on the seating of special categories of passengers.

7 Discipline and responsibilities. Amongst other subjects, emphasis should be placed on discipline and an individual's responsibilities in relation to:

- a. His ongoing competence and fitness to operate as a crew member with special regard to flight time limitation requirements; and
- b. Security procedures.

8 Passenger briefing/safety demonstrations. Training should be given in the preparation of passengers for normal and emergency situations.

**Comment:**

Delete 6,7 and 8 as is mostly relevant when commencing at an operator. In the case of changing a type relevant topics are covered in the ground course or safety training and must be credited to the trainee.

**Proposal:**

Split OR.OPS.135.FC Operator conversion training and checking into two chapters; one dealing with a change of type, the other with a change or start at a new operator. Requirements from 135 should be redistributed.

## Comment

Web based training is a growing aspect of aviation training, Many airlines and training organisations use web based training for subjects such as Dangerous Goods and Security. These courses and modules are approved by aviation authorities and Government Transport Departments alike. Provision must be made in these sections.

## Proposal

*2.1 Ground training should comprise a properly organised programme of ground instruction by training staff with adequate facilities, including any necessary audio, mechanical and visual aids. Private study may be adequate if the operator provides suitable manuals and/or study notes. Properly resourced and managed Web based training with a recognized training provider is also acceptable.*

comment by: Finnish CAA

Paragraph No: AMC1 OR.OPS.135.FC 6 c.

Comment: The text appears to require dangerous goods training as part of type conversion training and assumes that some dangerous goods may be allowed in the cabin depending on the type.

Justification: Dangerous goods are either allowed in the cabin (as a permitted item of passenger baggage), or they are forbidden. The type of aircraft has no bearing on this and so if personnel still hold a valid dangerous goods training qualification no further training is required.

Proposed Text (if applicable):

Delete AMC1 OR.OPS.135.FC 6 c. and consequentially re-number subsequent paragraphs.

comment by: *Ryanair*

Comment Ref 3.1

In a small airline this might be possible. In an airline of any size it is not possible when flight crew and cabin crew training can be taking place half a continent apart. It is simply not practical to make this a hard and fast requirement. Has any consideration been given to the fact that a flight crew course may not be running simultaneously with a cabin crew course? What is to be done in this case? DO the flight crew sit around until a cabin crew course arrives at this stage of training. Integrated flight crew/cabin crew training is catered for adequately during recurrent training. This is the proper location for this activity. Co-ordinated activity can be instructed using audio visual training aids including movies.

Proposal

comment by: *ECA - European Cockpit Association*

Comment on AMC2 OR.OPS.135.FC: change as follows:

## COURSE SYLLABUS – SYSTEM PANEL OPERATORS

1 Operator conversion training for ~~system-panel operators~~ **flight engineers** should approximate to that of pilots.

2 If the flight crew includes a pilot with the duties of a ~~systems-panel operator~~ **flight engineer**, he/~~she~~ should, after training and the initial check in these duties, operate a minimum number of sectors under the supervision of a nominated additional flight crew member. The minimum figures should be specified in the Operations Manual and should be selected after due note has been taken of the complexity of the aircraft and the experience of the flight

crew member.

Justification:

Remove the term "system panel operator". The station on the a/c is a flight engineer station.

The pilot operating in this position will have been given flight engineer duty training.

OR.OPS.025FC states flight engineer and flight engineer station.

comment

2747

comment by: CAA CZ

**AMC 2 OR.OPS.135.FC:** The usage of flight engineer (as required in OR.OPS.025.FC) instead of system panel operator is recommended.

comment

3448

comment by: UK CAA

**Page No:** 87

**Paragraph No:**

AMC2 OR.OPS.135.FC

**Comment:**

The title refers to "System Panel Operators" but in OR.OPS.135.FC there is no reference to them, only to flight crew. OR.OPS.025.FC refers to Flight Engineers and if the System Panel Operator in the AMC2 refers to Flight Engineers then it should say so. Flight Engineers are classified as flight crew. It is believed that there are no aircraft in the EU that have flight crew **other** than flight engineers and pilots.

**Justification:**

Consistency of flight crew classification throughout the document.

**Proposed Text (i f applicable):** Change the title from "System Panel Operators " to "*Flight Engineers*".

p. 87

comment

156

comment by: *EHOc*

General Comment

The rule and the associated GM is reliant upon a nuance of the word 'during'; will it be clear to operators that if a conversion course is not completed and the pilot reverts to another type, the course has been terminated and the pilot is no longer within (or in the terminology of the rule - 'during') a conversion course.

comment

421

comment by: *CAA-NL*

Comment regarding:

2 Under certain circumstances the course may have started and reached a stage

where, for unforeseen reasons, it is not possible to complete it without a delay. In

these circumstances the operator may allow the pilot to revert to the original type.

3 Before the resumption of the operator conversion course, the operator should

evaluate how much of the course needs to be recovered before continuing with the remainder of the course.

Suggestion CAA-NL:

is not in line with EU-OPS or section 2 material OPS-1.

New topics are introduced.

These new topics should be presented via a separate new NPA in a later stage.

comment

3867

comment by: *Ryanair*

Comment ref 8

What is this section trying to achieve? Is it to train the commander in the use of the PA system to "brief" passengers on normal and emergency situations? Or is it, God forbid, a serious attempt to get flight crew actively involved in normal and emergency procedures in the cabin? Do they leave the flight deck?

Proposal

OR.Ops.145

Recurrent training, 1.3.2, 3 years

Due to high number of training and checks for a crew involved in all operations we require training intervals of 5 years. Flight crew undergo 14 checks : HELO recency, NVIS (3 missions in 90 days), HHO (3 night hoist cycle in 90 days), HEMS (30 minutes IFR in 6 months), HEMS VMC prof check, HEMS Night prof check, HEMS line check, Recurrent training on each type, CRM annual check, OPS prof. check (check valid 6 months), Emergency and safety check (annual), Ground training (annual), Commercial OPS other than CAT (annual check), dangerous check (2 years).

comment by: *Krikor MICHIKIAN*

Comment for 1.2.3. a)

The respective provision for Cabin Crew Members (i.e. exits operation), is more prescriptive than the provision for Flight Crew Members.

As, however, the underlying safety objective seems to be the same (Cabin Crew Members as well as Flight Crew Members should be able to operate normal and emergency exits, ***in normal as well as in emergency cases, and including possible failures of the equipment, such as a failure of the power assist systems***), the regulation should adequately reflect **this** safety objective for **both**, Cabin and Flight Crew Members.

Furthermore, as the Community Rulemaking System prevents! the existence of two different provisions when the objective of the requirement is the same (refer to NPA 2009-02a, page 10 of 123, par.24, "...separate sets of provisions shall only exist when the requirements are different..."), the present wording for Flight Crew Members seems that does not address the subject adequately, and should we need the same safety objectives to apply for Flight Crew Members, the wording should be the same as for Cabin Crew Members.

comment by: *CAA-NL*

Comment regarding:

1.2.4 The successful resolution of aircraft emergencies requires interaction between flight crew and cabin/technical crew and emphasis should be placed on the importance of effective coordination and twoway communication between all crew members in various emergency situations.

1.2.5 Emergency and Safety Equipment training should include joint practice in aircraft evacuations so that all who are involved are aware of the duties other crew members should perform. When such practice is not possible, combined flight crew and cabin/technical crew training should include joint discussion of emergency scenarios.

Suggestion CAA-NL:

is not in line with EU-OPS or section 2 material OPS-1.

New topics are introduced.

These new topics should be presented via a separate new NPA in a later stage.

Comment regarding:

2.1.1.5 Operator proficiency checks should be conducted by a type rating examiner (TRE), a class rating examiner (CRE) or a synthetic flight examiner (SFE), as applicable.

Suggestion:

For A-to-A operators, a person appointed by the compagny

Reason:

In line with EU-OPS

comment

comment by: *claire.amos*

1.2.3:

Relevance to Operation: In what circumstance would this situation arise during a flight? Inflight, the CC would fight a fire. On the ground, the flt crew would evacuate the a/c. Therefore this training is not relevant to our operation. Suggest making fire fighting training relevant to operation.

Clarification required on the term 'smoke filled cabin' with regard to density of smoke. There are serious Health and Safety' concerns regarding carrying out fire fighting drills in this environment.

1.2.4:

Question: What is the value of this training as it is not relevant to our operation? Inflight, the Cabin Crew would manage a first aid situation. on the ground an ambulance could be called.

Cost impact: the addition of First Aid into triennial recurrent training will increase the duration of the course by one day.

comment

comment by: *Bristow Helicopters*

**Comment** Paragraph 1.2.3 a. requires every 3 years the actual operation of all types of exits. There are no suitable training aids available for helicopters and conducting the training on an actual line aircraft results in many hours maintenance and the possibility of damage to the mechanisms due to the varying types of exits fitted to helicopters. Effective training can also be achieved by a combination of CBT/video training reinforced by touch drill training on the actual aircraft without the need to physically operate the mechanisms and jettison the exits.

**Proposed amendment**

1.2.3 a. Actual operation of all types of exits, **or for helicopters, demonstration of the method of operation by means of video or CBT, combined with touch drill training conducted on the helicopter.**

comment

669

comment by: *Bristow Helicopters*

**Comment** Operator Proficiency Check Helicopters 2.1.2.1 item s. "Settling with power" and t. "Loss of tail rotor effectiveness". These items are additional to current JAR-OPS 3 requirements and are more appropriate to recurrent aircraft/FSTD training than the OPC. They can only be safely practised in an FSTD which has this capability. Since LTE is a combination of aerodynamic and atmospheric effects, not all FSTD will be able to adequately replicate this effect.

**Proposed amendment** Remove items s and t from the Helicopter OPC schedule and include in aircraft/FSTD training instead. To accommodate this, restructure AMC1 OR.OPS.145.FC Section 1.4 as follows

1.4 Aircraft/FSTD training

**1.4.1 General**

**1.4.1.1** The aircraft/FSTD training programme should be established in a way that all major failures of aircraft systems and associated procedures will have been covered in the preceding 3 year period.

**1.4.1.2** When engine out manoeuvres are carried out in an aircraft, the engine failure should be simulated.

**1.4.1.3** Aircraft/FSTD training may be combined with the operator proficiency check

**1.4.1.4** When the aircraft/FSTD training is conducted within 3 calendar months prior to the expiry of the 12 calendar months period, the next aircraft/FSTD training should be completed within 12 calendar months of the original expiry date of the previous training.

**1.4.2 Helicopters**

**1.4.2.1** Where a suitable FSTD is available, it should be used for the aircraft/FSTD training programme unless discounted by risk assessment taking into account the complexity of the helicopter;

**1.4.2.2** The recurrent training should include the following additional items, which should be completed in an FSTD:

**a. Settling with power and vortex ring;**

**b. Loss of tail rotor effectiveness;**

**c. Ground resonance;**

**d. Where operations at night to offshore installations are conducted, training in night deck take-off and landing procedures including recovery from disorientation and/or unusual attitudes;**

**e. Where IFR operations are conducted, training in the visual landing from an instrument approach with the weather conditions at minima;**

**Justification** I assume that the items "settling with power" and "LTE" were inserted into the helicopter OPC schedule to address incidents or accidents associated with these items. Equally, there have been incidents and accidents associated with the above additional items, and they should therefore form part of the recurrent training programme. All items above can only be achieved effectively and safely in an FSTD. Item 1.4.2.1 above refers to my previous comment number 651 on the subject of use of FSTD's in helicopter training. Item e. is not currently covered in either FCL IR course or the Operator Training, since training approaches tend to culminate in either go around under the screens, landing by the instructor pilot, or landing by the trainee but with no weather considerations. The transition from IFR approach

to visual landing at DA/MDA in marginal weather conditions has the potential for error unless specific training is in place. Such training is also necessary for the progression of new co-pilots in multi-pilot operations, otherwise there is no controlled method by which they can safely gain such experience.

comment

670

comment by: *Bristow Helicopters*

**Comment** 2.1.2.2 Item a. specifies that the precision approach must include a simulated engine failure. This is unnecessarily restrictive and not representative of real world conditions, where engine failures may occur during any form of approach. Part FCL already allows the engine failure to be included in either precision or non precision approach, and this should be reflected in the OPC.

**Proposed Amendment**

a. Precision approach to minima ~~with, in the case of multi-engine helicopters, a simulated failure of one engine;~~

b. Go-around on instruments from minima with, in the case of multi-engine helicopters, a simulated failure of one engine;

c. Non precision approach to minima;

**d. In the case of multi-engine helicopters, a simulated failure of one engine to be included in either the precision or non precision approach to minima;**

e. Landing with a simulated failure of one or more engines; and

f. Where appropriate to the helicopter type, approach with flight control system/flight director system malfunctions, flight instrument and navigation equipment failures.

**Justification** This flexibility is allowed under Part FCL during the IR recurrent check, and is offers more realistic training and checking. The same should also be applied to the Aeroplane OPC schedule.

comment

671

comment by: *Bristow Helicopters*

**Comment** Section 4.2. specifies that FSTD content of the training programme must be delivered by an SFI. There is no reason why an FI or TRI cannot deliver FSTD training, either from the instructor station if he/she has completed an IOS course, or from a pilots seat if a qualified IOS operator is also carried.

**Proposed amendment**

4.2 Flying Training - by a Flight Instructor (FI), Type Rating Instructor (TRI) or Class Rating Instructor (CRI) or, in the case of FSTD content, a Synthetic Flight Instructor (SFI), **FI, TRI or CRI, .....**

comment

673

comment by: *Bristow Helicopters*

**Comment** 2.3.2 CRM assessment should not be limited to the Line Check and an alternative of assessing CRM during FSTD proficiency checks should be allowed. Helicopters in particular have less ability for the CRM assessor to occupy an observers seat or suitable passenger seat due to payload and seat configuration factors. The EASA rule 2.3.6 has removed the option of assessing CRM whilst occupying a pilots seat, which was available in JAR-OPS 3. Helicopter operators therefore need the option to assess CRM during proficiency checks conducted in FSTD. The best way to incorporate this possibility, whilst retaining the existing text relating to CRM assessment during the Line Check, would be to amend AMC OR.OPS.030.FC paragraph 8.5 and AMC1 OR.OPS.145.FC 2.3.2 as follows:

**Proposed Amendment**

AMC OR.OPS.030.FC

8.5 methodology of CRM skills assessment:

a. unchanged;

b. unchanged;

c. The assessment should be based on the following principles:

iii. assessments should include behaviour which contributes to a technical failure, such technical failure being errors leading to an event which requires debriefing by the person conducting the line check;

**iv. assessment may be conducted during the line check, or during the proficiency check conducted in an FSTD;**

v. the crew and, where needed, the individual are verbally debriefed.

AMC1 OR.OPS.145.FC

2.3.2 **Unless previously assessed during a proficiency check, the flight crew should be assessed on their CRM skills in accordance .....**

**Justification** Assessment of CRM skill during a proficiency check conducted in an FSTD is an equally valid method. It affords the TRE (who is also trained to instruct and assess CRM) an opportunity to observe a crew conducting normal, abnormal and emergency procedures in a realistic scenario, which is arguably more effective for CRM assessment than the Line Check. Also, AMC OR.OPS.030.FC 8.9 already establishes the principle of assessing CRM during proficiency checks.

**Relevant Text:**

g. First aid, appropriate to the aircraft type, the kind of operation and crew complement.

**Comment:**

Recurrent First Aid Training is a new requirement to flight crew. The form of appropriate training is not mentioned. For passenger operator Cabin crew members are trained to provide first aid

**Proposal:**

Delete : g. First aid, appropriate to the aircraft type, the kind of operation and crew complement.

comment 1058 comment by: AEA

**Relevant Text:**

2.3.7 Where a pilot is required to operate as pilot flying and pilot non-flying, he should be checked on one sector as pilot flying and on another sector as pilot non-flying.

However, where an operator's procedures require integrated flight preparation, integrated cockpit initialisation and that each pilot performs both flying and non-flying duties on the same sector, then the line check may be performed on a single sector.

**Comment:**

Limiting the performance of single sector Line Checks to special operator's procedures is not reasonable. The regulator should aim for a level playing field.

**Proposal:**

However, where an operator's procedures require integrated flight preparation, integrated cockpit initialisation, then the line check may be performed on a single sector, provided that each pilot performs both flying and non-flying duties on this sector .

comment 1144 comment by: Austro Control GmbH

General comment to 2.3.2:

an assessment of a flight crew cannot be performed on aeroplanes without an observer's seat.

In that case the person conducting the line check is part of the flight crew and only one crew member will be checked.

This seems to be in contradiction to the checking of CRM-skills.

comment 1175

comment by: AEA

**Comment:**

OR.OPS.145.FC adequately addresses the requirements of EU-OPS 1.965 but there is no specific recognition of the enhanced OPC, Line Check and SEP validity periods as currently prescribed in EU-OPS 1.978.

The alternative schedule for checking provided in EU-OPS 1.978 is integral to the benefits of allowing Operators to provide valuable additional Operator Specific Training. The removal of this specific recognition appears to be an unintentional omission on EASA's part and seemingly with no safety justification.

We cannot believe that it is the intention of EASA to discontinue the current ATQP arrangements for Operators who already have sought and gained approval for an ATQP programme having already demonstrated that they meet the requirements of EU-OPS 1.978 and the associated AMC.

**Proposal:**

Include the following new AMC material based on Appendix 1 to EU-OPS 1.978 and the associated guidance material in JAA TGL 44 to complement the new regulation OR.OPS.150.FC (see previous comment on OR OPS 145 FC)

**AMC OR.OPS.150.FC - Alternative training and qualification programme****(a) An operator's ATQP may apply to the following requirements that relate to training and qualifications:**

1. Low Visibility Operations – Training and Qualifications.
2. Conversion training and checking.
3. Differences training and familiarisation training.
4. Nomination as commander.
5. Recurrent training and checking.
6. Operation on more than one type or variant.

**(b) Components of the ATQP – an alternative training and qualification programme shall comprise the following:**

1. Documentation that details the scope and requirements of the programme;
2. A task analysis to determine the tasks to be analysed in terms of:
  - (i) knowledge;
  - (ii) the required skills;
  - (iii) the associated skill based training;
 and, where appropriate
  - (iv) the validated behavioural markers.
3. Curricula – the curriculum structure and content shall be determined by task analysis, and shall include proficiency objectives including when and how those objectives shall be met. The process for curriculum development shall be acceptable to the Authority;
4. A specific training programme for:
  - (i) each aeroplane type/class within the ATQP;
  - (ii) the instructors (Class rating instructor rating/Synthetic flight instructor authorisation/Type rating instructor rating – CRI/SFI/TRI), and other personnel undertaking flight crew instruction;
  - (iii) the examiners (Class rating examiner/Synthetic flight examiner/Type rating examiner – CRE/SFE/TRE); to include a method for the standardisation of the instructors and examiners;
5. A feedback loop for the purpose of curriculum validation and refinement, and to ascertain that the programme meets its proficiency objectives;

6. A method for the assessment of flight crew both during conversion and recurrent training and checking. The assessment process shall include event-based assessment as part of the LOE. The method of assessment shall comply with the provisions of OPS 1.965;
7. An integrated system of quality control, that ensures compliance with all the requirements processes and procedures of the programme;
8. A process that describes the method to be used if the monitoring and evaluation programmes do not ensure compliance with the established proficiency and qualification standards for flight crew;
9. A data monitoring/analysis programme.

**(c) Implementation**

The operator shall develop an evaluation and implementation strategy acceptable to the Authority;

the following requirements shall be fulfilled:

1. The implementation process shall include the following stages:

(i) a safety case that substantiates the validity of:

(A) the revised training and qualification standards when compared with the standards achieved under OR.OPS prior to the introduction of ATQP.

(B) any new training methods implemented as part of ATQP.

If approved by the Authority the operator may establish an equivalent method other than a formal safety case.

(ii) Undertake a task analysis as required by paragraph (b)2 above in order to establish the operator's programme of targeted training and the associated training objectives.

(iii) A period of operation whilst data is collected and analysed to ensure the efficacy of the safety case or equivalent and validate the task analysis. During this period the operator shall continue to operate to the pre-ATQP OR.OPS requirements. The length of this period shall be agreed with the authority;

2. The operator may then be approved to conduct training and qualification as specified under the ATQP.

**(d) Terminology**

1 Line Oriented Evaluation (LOE). LOE is an evaluation methodology used in the ATQP to evaluate

trainee performance, and to validate trainee proficiency. LOEs consist of flight simulator scenarios that are developed by the operator in accordance with a methodology approved as part of the ATQP. The LOE should be realistic and include appropriate weather scenarios and in addition should fall within an acceptable range of difficulty. The LOE should include the use of validated event sets to provide the basis for event based assessment. See paragraph 4 below.

2 Line Oriented Quality Evaluation (LOQE). LOQE is one of the tools used to help evaluate the

overall performance of an operation. LOQEs consist of line flights that are observed by appropriately

qualified operator personnel to provide feedback to validate the ATQP. The LOQE should be designed to look at those elements of the operation that are unable to be monitored by FDM or Advanced FDM programmes.

3 Skill based training. Skill based training requires the identification of specific knowledge and skills.

The required knowledge and skills are identified within an ATQP as part of a task analysis and are used to provide targeted training.

4 Event based Assessment. This is the assessment of flight crew to provide assurance that the

*required knowledge and skills have been acquired. This is achieved within an LOE. Feedback to the flight crew is an integral part of event based assessment.]*

**(e) Requirements, Scope and Documentation of the Programme**

*The documentation should demonstrate how the operator should establish the scope and requirements of the programme. The documentation should include:*

*1 How the ATQP should enable the operator to establish an alternative training programme that substitutes the requirements as listed in OR-OPS. The programme should demonstrate that the operator is able to improve the training and qualification standards of flight crew to a level that exceeds the standard prescribed in OR-OPS.*

*2 The operator's training needs and established operational and training objectives.*

*3 How the operator defines the process for designing of and gaining approval for the operator's flight crew qualification programmes. This should include quantified operational and training objectives identified by the operator's internal monitoring programmes. External sources may also be used.*

*4 How the programme will:*

- a. Enhance safety;*
- b. Improve training and qualification standards of flight crew;*
- c. Establish attainable training objectives;*
- d. Integrate CRM in all aspects of training;*
- e. Develop a support and feedback process to form a self-correcting training system;*
- f. Institute a system of progressive evaluations of all training to enable consistent and uniform monitoring of the training undertaken by flight crew;*
- g. Enable the operator to be able to respond to the new aeroplane technologies and changes in the operational environment;*
- h. Foster the use of innovative training methods and technology for flight crew instruction and the evaluation of training systems;*
- i. Make efficient use of training resources, specifically to match the use of training media to the training needs.*

**(f) Task Analysis**

*For each aeroplane type/class to be included within the ATQP the operator should establish a systematic review that determines and defines the various tasks to be undertaken by the flight crew when operating that type(s)/class. Data from other types/class may also be used. The analysis should determine and describe the knowledge and skills required to complete the various tasks specific to the aeroplane type/class and/or type of operation. In addition the analysis should identify the appropriate behavioural markers that should be exhibited. The task analysis should be suitably validated in accordance with paragraph (c)(iii). The task analysis, in conjunction with the data gathering programme(s) permit the operator to establish a programme of targeted training together with the associated training objectives described in paragraph (g) below.*

**(g) Training Programme**

*The training programme should have the following structure:*

- 1 Curriculum.*

- 1.1 Daily lesson plan.
- 2 The curriculum should specify the following elements:
  - 2.1 Entry requirements: A list of topics and content, describing what training level will be required before start or continuation of training.
  - 2.2 Topics: A description of what will be trained during the lesson;
  - 2.3 Targets/Objectives
    - a. Specific target or set of targets that have to be reached and fulfilled before the training course can be continued.
    - b. Each specified target should have an associated objective that is identifiable both by the flight crew and the trainers.
    - c. Each qualification event that is required by the programme should specify the training that is required to be undertaken and the required standard to be achieved. (See paragraph j below)
- 3 Each lesson/course/training or qualification event should have the same basic structure. The topics related to the lesson have to be listed and the lesson targets should be unambiguous.
- 4 Each lesson/course or training event whether classroom, CBT or simulator should specify the required topics with the relevant targets to be achieved.

**(h) Training Personnel**

- 1 Personnel who perform training and checking of flight crew in an operator's ATQP should receive the following additional training on:
  - 1.1 ATQP principles and goals;
  - 1.2 Knowledge/skills/behaviour as learned from task analysis;
  - 1.3 LOE/ LOFT Scenarios to include triggers / markers / event sets / observable behaviour;
  - 1.4 Qualification standards;
  - 1.5 Harmonisation of assessment standards;
  - 1.6 Behavioural markers and the systemic assessment of CRM;
  - 1.7 Event sets and the corresponding desired knowledge/skills and behaviour of the flight crew;
  - 1.8 The processes that the operator has implemented to validate the training and qualification standards and the instructors part in the ATQP quality control; and
  - 1.9 LOQE.

**(i) Feedback Loop**

- 1 The feedback should be used as a tool to validate that the curricula are implemented as specified by the ATQP; this enables substantiation of the curriculum, and that proficiency and training objectives have been met. The feedback loop should include data from operations flight data monitoring, advanced FDM programme and LOE/LOQE programmes. In addition the evaluation process shall describe whether the overall targets/objectives of training are being achieved and shall prescribe any corrective action that needs to be undertaken.
- 2 The programmes established quality control mechanisms should at least review the following:
  - 2.1 Procedures for approval of recurrent training;
  - 2.2 ATQP instructor training approvals;
  - 2.3 Approval of event set(s) for LOE/LOFT;
  - 2.4 Procedures for conducting LOE and LOQE.

**(j) Crew Performance Measurement and Evaluation**

1 The qualification and checking programmes should include at least the following elements:

1.1 A specified structure;

1.2 Elements to be tested/examined;

1.3 Targets and/or standards to be attained;

1.4 The specified technical and procedural knowledge and skills, and behavioural markers to be exhibited.

2 An LOE event should comprise of tasks and sub-tasks performed by the crew under a specified set

of conditions. Each event has one or more specific training targets/objectives, which require the

performance of a specific manoeuvre, the application of procedures, or the opportunity to practise cognitive, communication or other complex skills. For each event the proficiency that is required to be achieved should be established.

Each event should include a range of circumstances under which the crews' performance is to be measured and evaluated. The conditions pertaining to each event should also be established and they may include the prevailing meteorological conditions (ceiling, visibility, wind, turbulence etc.); the operational environment (navigation aid inoperable etc.); and the operational contingencies (non-normal operation etc).

3 The markers specified under the operator's ATQP should form one of the core elements in

determining the required qualification standard. A typical set of markers are shown in the table below:

<b>EVENT</b>	<b>MARKER</b>
Awareness	1 Monitors and reports changes in automation status.
of Aeroplane Systems:	2 Applies closed loop principle in all relevant situations.
	3 Uses all channels for updates.
	4 Is aware of remaining technical resources

4 The topics / targets integrated into the curriculum have to be measurable and progression on any

training/course is only allowed if the targets are fulfilled.

### **(k) Data Monitoring/Analysis Programme**

1 The data analysis programme should consist of:

1.1 A Flight Data Monitoring (FDM) programme: This programme should include systematic evaluation of operational data derived from equipment that is able to record the flight profile and relevant operational information during flights conducted by the operator's aeroplane. Data collection should reach a minimum of 60% of all relevant flights conducted by the operator before ATQP approval is granted. This proportion may be increased at the discretion of the Authority.

1.2 An Advanced FDM when an extension to the ATQP is requested: An advanced FDM programme is determined by the level of integration with other safety initiatives implemented by the operator, such as the operator's Quality System. The programme should include both systematic evaluations of data from an FDM programme and flight crew training events for the relevant crews. Data collection should reach a minimum of 80% of all relevant flights and training conducted by the operator. This proportion may be varied at the discretion of the Authority.

*2 The purpose of either an FDM or advanced FDM programme is to enable the operator to:*

- 2.1 Provide data to support the programme's implementation and justify any changes to the ATQP;*
- 2.2 Establish operational and training objectives based upon an analysis of the operational environment;*
- 2.3 Monitor the effectiveness of flight crew training and qualification.*

*3 Data Gathering.*

*3.1 FDM programmes should include a system that captures flight data, and then transforms the data into an appropriate format for analysis. The programme should generate information to assist the operations safety personnel in analysing the data. The analysis should be made available to the ATQP postholder.*

*3.2 The data gathered should:*

- a. Include all fleets that plan to operate under the ATQP;*
- b. Include all crews trained and qualified under the ATQP;*
- c. Be established during the implementation phase of ATQP; and*
- d. Continue throughout the life of the ATQP.*

*4 Data Handling.*

*4.1 The operator should establish a process, which ensures the strict adherence to any data handling protocols, agreed with flight crew representative bodies, to ensure the confidentiality of individual flight crew members.*

*4.2 The data handling protocol should define the maximum period of time that detailed FDM or advanced FDM programme data, including exceedences, should be retained. Trend data may be retained permanently.*

*5 An operator that has an acceptable operations flight data monitoring programme prior to the proposed introduction of ATQP may, with the approval of the Authority, use relevant data from other fleets not part of the proposed ATQP.*

### **(I) Safety Case**

*1.1 A documented body of evidence that provides a demonstrable and valid justification that the programme (ATQP) is adequately safe for the given type of operation. The safety case should encompass each phase of implementation of the programme and be applicable over the lifetime of the programme that is to be overseen.*

*1.2 The safety case should:*

- a. Demonstrate the required level of safety;*
- b. Ensure the required safety is maintained throughout the lifetime of the programme;*
- c. Minimise risk during all phases of the programmes implementation and operation.*

*2 Elements of a Safety Case:*

*2.1 Planning: Integrated and planned with the operation (ATQP) that is to be justified;*

*2.2 Criteria: Develop the applicable criteria - see paragraph 3 below;*

*2.3 Documentation: Safety related documentation – including a safety checklist;*

*2.4 Programme of implementation: To include controls and validity checks;*

*2.5 Oversight: Review and audits.*

*3 Criteria for the establishment of a Safety Case.*

*3.1 The Safety Case should:*

- a. Be able to demonstrate that the required or equivalent level of safety is maintained throughout all phases of the programme, including as required by paragraph (c) below;*
- b. Be valid to the application and the proposed operation (ATQP);*
- c. Be adequately safe and ensure the required regulatory safety standards or approved equivalent safety standards are achieved;*
- d. Be applicable over the entire lifetime of the programme;*
- e. Demonstrate Completeness and Credibility of the programme;*
- f. Be fully documented;*
- g. Ensure integrity of the operation and the maintenance of the operations and training infra-structure;*
- h. Ensure robustness to system change;*
- i. Address the impact of technological advance, obsolescence and change;*
- j. Address the impact of regulatory change.*

*4 In accordance with paragraph (c) the operator may develop an equivalent method other than that specified above.*

**Page No: 88**

**Paragraph No:**

AMC1 OR.OPS.145.FC Recurrent training and checking

**Comment:**

The requirement for crews to operate all types of exits every three years is no longer a practical rule for some helicopters, with multiple exits and practical complications of maintenance requirements, seal replacement etc.

**Justification:**

Many modern helicopters have emergency exits jettison and opening systems that do not lend themselves to repeated use: indeed the S92 cockpit jettison window can take some 10 man hours to replace. Furthermore the passengers seated adjacent to emergency windows never actually practice jettisoning the windows. An alternative AMC should be allowed.

comment by: TAP Portugal

**Comment:**

OR.OPS.145.FC adequately addresses the requirements of EU-OPS 1.965 but there is no specific recognition of the enhanced OPC, Line Check and SEP validity periods as currently prescribed in EU-OPS 1.978.

The alternative schedule for checking provided in EU-OPS 1.978 is integral to the benefits of allowing Operators to provide valuable additional Operator Specific Training. The removal of this specific recognition appears to be an unintentional omission on EASA's part and seemingly with no safety justification. We cannot believe that it is the intention of EASA to discontinue the current ATQP arrangements for Operators who already have sought and gained approval for an ATQP programme having already demonstrated that they meet the requirements of EU-OPS 1.978 and the associated AMC.

**Proposal:**

Include the following new AMC material based on Appendix 1 to EU-OPS 1.978 and the associated guidance material in JAA TGL 44 to complement the new regulation OR.OPS.150.FC (see previous comment on OR OPS 145 FC)

**AMC OR.OPS.150.FC - Alternative training and qualification programme**  
**(a) An operator's ATQP may apply to the following requirements that relate to training and qualifications:**

1. Low Visibility Operations –Training and Qualifications.
2. Conversion training and checking.
3. Differences training and familiarisation training.
4. Nomination as commander.
5. Recurrent training and checking.
6. Operation on more than one type or variant.

**(b) Components of the ATQP — an alternative training and qualification programme shall comprise the following:**

1. Documentation that details the scope and requirements of the programme;
2. A task analysis to determine the tasks to be analysed in terms of:
  - (i) knowledge;
  - (ii) the required skills;
  - (iii) the associated skill based training;
 and, where appropriate
  - (iv) the validated behavioural markers.
3. Curricula — the curriculum structure and content shall be determined by task analysis, and shall include proficiency objectives including when and how those objectives shall be met. The process for curriculum development shall be acceptable to the Authority;
4. A specific training programme for:
  - (i) each aeroplane type/class within the ATQP;
  - (ii) the instructors (Class rating instructor rating/Synthetic flight instructor authorisation/Type rating instructor rating — CRI/SFI/TRI), and other personnel undertaking flight crew instruction;
  - (iii) the examiners (Class rating examiner/Synthetic flight examiner/Type rating examiner — CRE/SFE/TRE); to include a method for the standardisation of the instructors and examiners;
5. A feedback loop for the purpose of curriculum validation and refinement, and to ascertain that the programme meets its proficiency objectives;
6. A method for the assessment of flight crew both during conversion and recurrent training and checking. The assessment process shall include event-based assessment as part of the LOE. The method of assessment shall comply with the provisions of OPS 1.965;
7. An integrated system of quality control, that ensures compliance with all the requirements processes and procedures of the programme;
8. A process that describes the method to be used if the monitoring and evaluation programmes do not ensure compliance with the established proficiency and qualification standards for flight crew;
9. A data monitoring/analysis programme.

**(c) Implementation**

The operator shall develop an evaluation and implementation strategy acceptable to the Authority;

the following requirements shall be fulfilled:

1. The implementation process shall include the following stages:
  - (i) a safety case that substantiates the validity of:
    - (A) the revised training and qualification standards when compared with the standards achieved under OR.OPS prior to the introduction of ATQP.
    - (B) any new training methods implemented as part of ATQP.
 If approved by the Authority the operator may establish an equivalent method other than a formal safety case.
  - (ii) Undertake a task analysis as required by paragraph (b)2 above in order to establish the operator's programme of targeted training and the associated training objectives.
  - (iii) A period of operation whilst data is collected and analysed to ensure the efficacy of the safety case or equivalent and validate the task analysis. During this period the operator shall continue to operate to the pre-ATQP OR.OPS requirements. The length of this period shall be agreed with the authority;
2. The operator may then be approved to conduct training and qualification as specified under the ATQP.

**(d) Terminology**

1 Line Oriented Evaluation (LOE). LOE is an evaluation methodology used in the ATQP to evaluate trainee performance, and to validate trainee proficiency. LOEs consist of flight simulator scenarios that are developed by the operator in

accordance with a methodology approved as part of the ATQP. The LOE should be realistic and include appropriate weather scenarios and in addition should fall within an acceptable range of difficulty. The LOE should include the use of validated event sets to provide the basis for event based assessment. See paragraph 4 below.

2 Line Oriented Quality Evaluation (LOQE). LOQE is one of the tools used to help evaluate the overall performance of an operation. LOQEs consist of line flights that are observed by appropriately qualified operator personnel to provide feedback to validate the ATQP. The LOQE should be designed to look at those elements of the operation that are unable to be monitored by FDM or Advanced FDM programmes.

3 Skill based training. Skill based training requires the identification of specific knowledge and skills.

The required knowledge and skills are identified within an ATQP as part of a task analysis and are used to provide targeted training.

4 Event based Assessment. This is the assessment of flight crew to provide assurance that the required knowledge and skills have been acquired. This is achieved within an LOE. Feedback to the flight crew is an integral part of event based assessment.]

**(e) Requirements, Scope and Documentation of the Programme**

The documentation should demonstrate how the operator should establish the scope and requirements of the programme. The documentation should include:

1 How the ATQP should enable the operator to establish an alternative training programme that substitutes the requirements as listed in OR-OPS. The programme should demonstrate that the operator is able to improve the training and qualification standards of flight crew to a level that exceeds the standard prescribed in OR-OPS.

2 The operator's training needs and established operational and training objectives.

3 How the operator defines the process for designing of and gaining approval for the operator's flight crew qualification programmes. This should include quantified operational and training objectives identified by the operator's internal monitoring programmes. External sources may also be used.

4 How the programme will:

- a. Enhance safety;
- b. Improve training and qualification standards of flight crew;
- c. Establish attainable training objectives;
- d. Integrate CRM in all aspects of training;
- e. Develop a support and feedback process to form a self-correcting training system;
- f. Institute a system of progressive evaluations of all training to enable consistent and uniform monitoring of the training undertaken by flight crew;
- g. Enable the operator to be able to respond to the new aeroplane technologies and changes in the operational environment;
- h. Foster the use of innovative training methods and technology for flight crew instruction and the evaluation of training systems;
- i. Make efficient use of training resources, specifically to match the use of training media to the training needs.

**(f) Task Analysis**

For each aeroplane type/class to be included within the ATQP the operator should establish a systematic review that determines and defines the various tasks to be undertaken by the flight crew when operating that type(s)/class. Data from other types/class may also be used. The analysis should determine and describe the knowledge and skills required to complete the various tasks specific to the aeroplane type/class and/or type of operation. In addition the analysis should identify the appropriate behavioural markers that should be exhibited. The task analysis should be suitably validated in accordance with

paragraph (c)(iii). The task analysis, in conjunction with the data gathering programme(s) permit the operator to establish a programme of targeted training together with the associated training objectives described in paragraph (g) below.

**(g) Training Programme**

The training programme should have the following structure:

1 Curriculum.

1.1 Daily lesson plan.

2 The curriculum should specify the following elements:

2.1 Entry requirements: A list of topics and content, describing what training level will be required before start or continuation of training.

2.2 Topics: A description of what will be trained during the lesson;

2.3 Targets/Objectives

a. Specific target or set of targets that have to be reached and fulfilled before the training course can be continued.

b. Each specified target should have an associated objective that is identifiable both by the flight crew and the trainers.

c. Each qualification event that is required by the programme should specify the training that is required to be undertaken and the required standard to be achieved. (See paragraph j below)

3 Each lesson/course/training or qualification event should have the same basic structure. The topics related to the lesson have to be listed and the lesson targets should be unambiguous.

4 Each lesson/course or training event whether classroom, CBT or simulator should specify the required topics with the relevant targets to be achieved.

**(h) Training Personnel**

1 Personnel who perform training and checking of flight crew in an operator's ATQP should receive the following additional training on:

1.1 ATQP principles and goals;

1.2 Knowledge/skills/behaviour as learned from task analysis;

1.3 LOE/ LOFT Scenarios to include triggers / markers / event sets / observable behaviour;

1.4 Qualification standards;

1.5 Harmonisation of assessment standards;

1.6 Behavioural markers and the systemic assessment of CRM;

1.7 Event sets and the corresponding desired knowledge/skills and behaviour of the flight crew;

1.8 The processes that the operator has implemented to validate the training and qualification standards and the instructors part in the ATQP quality control; and

1.9 LOQE.

**(i) Feedback Loop**

1 The feedback should be used as a tool to validate that the curricula are implemented as specified by the ATQP; this enables substantiation of the curriculum, and that proficiency and training objectives have been met. The feedback loop should include data from operations flight data monitoring, advanced FDM programme and LOE/LOQE programmes. In addition the evaluation process shall describe whether the overall targets/objectives of training are being achieved and shall prescribe any corrective action that needs to be undertaken.

2 The programmes established quality control mechanisms should at least review the following:

2.1 Procedures for approval of recurrent training;

2.2 ATQP instructor training approvals;

2.3 Approval of event set(s) for LOE/LOFT;

2.4 Procedures for conducting LOE and LOQE.

**(j) Crew Performance Measurement and Evaluation**

1 The qualification and checking programmes should include at least the following elements:

1.1 A specified structure;

1.2 Elements to be tested/examined;

1.3 Targets and/or standards to be attained;

1.4 The specified technical and procedural knowledge and skills, and behavioural markers to be exhibited.

2 An LOE event should comprise of tasks and sub-tasks performed by the crew under a specified set of conditions. Each event has one or more specific training targets/objectives, which require the performance of a specific manoeuvre, the application of procedures, or the opportunity to practise cognitive, communication or other complex skills. For each event the proficiency that is required to be achieved should be established. Each event should include a range of circumstances under which the crews' performance is to be measured and evaluated. The conditions pertaining to each event should also be established and they may include the prevailing meteorological conditions (ceiling, visibility, wind, turbulence etc.); the operational environment (navigation aid inoperable etc.); and the operational contingencies (non-normal operation etc).

3 The markers specified under the operator's ATQP should form one of the core elements in determining the required qualification standard. A typical set of markers are shown in the table below:

<b>EVENT</b>	<b>MARKER</b>
Awareness	1 Monitors and reports changes in automation status.
of	2 Applies closed loop principle in all relevant situations.
Aeroplane	
Systems:	3 Uses all channels for updates.
	4 Is aware of remaining technical resources

4 The topics / targets integrated into the curriculum have to be measurable and progression on any training/course is only allowed if the targets are fulfilled.

#### **(k) Data Monitoring/Analysis Programme**

1 The data analysis programme should consist of:

1.1 A Flight Data Monitoring (FDM) programme: This programme should include systematic evaluation of operational data derived from equipment that is able to record the flight profile and relevant operational information during flights conducted by the operator's aeroplane. Data collection should reach a minimum of 60% of all relevant flights conducted by the operator before ATQP approval is granted. This proportion may be increased at the discretion of the Authority.

1.2 An Advanced FDM when an extension to the ATQP is requested: An advanced FDM programme is determined by the level of integration with other safety initiatives implemented by the operator, such as the operator's Quality System. The programme should include both systematic evaluations of data from an FDM programme and flight crew training events for the relevant crews. Data collection should reach a minimum of 80% of all relevant flights and training conducted by the operator. This proportion may be varied at the discretion of the Authority.

2 The purpose of either an FDM or advanced FDM programme is to enable the operator to:

2.1 Provide data to support the programme's implementation and justify any changes to the ATQP;

2.2 Establish operational and training objectives based upon an analysis of the operational environment;

2.3 Monitor the effectiveness of flight crew training and qualification.

3 Data Gathering.

3.1 FDM programmes should include a system that captures flight data, and then transforms the data into an appropriate format for analysis. The

programme should generate information to assist the operations safety personnel in analysing the data. The analysis should be made available to the ATQP postholder.

3.2 The data gathered should:

- a. Include all fleets that plan to operate under the ATQP;
- b. Include all crews trained and qualified under the ATQP;
- c. Be established during the implementation phase of ATQP; and
- d. Continue throughout the life of the ATQP.

4 Data Handling.

4.1 The operator should establish a process, which ensures the strict adherence to any data handling protocols, agreed with flight crew representative bodies, to ensure the confidentiality of individual flight crew members.

4.2 The data handling protocol should define the maximum period of time that detailed FDM or advanced FDM programme data, including exceedences, should be retained. Trend data may be retained permanently.

5 An operator that has an acceptable operations flight data monitoring programme prior to the proposed introduction of ATQP may, with the approval of the Authority, use relevant data from other fleets not part of the proposed ATQP.

### **(I) Safety Case**

1.1 A documented body of evidence that provides a demonstrable and valid justification that the programme (ATQP) is adequately safe for the given type of operation. The safety case should encompass each phase of implementation of the programme and be applicable over the lifetime of the programme that is to be overseen.

1.2 The safety case should:

- a. Demonstrate the required level of safety;
- b. Ensure the required safety is maintained throughout the lifetime of the programme;
- c. Minimise risk during all phases of the programmes implementation and operation.

2 Elements of a Safety Case:

2.1 Planning: Integrated and planned with the operation (ATQP) that is to be justified;

2.2 Criteria: Develop the applicable criteria - see paragraph 3 below;

2.3 Documentation: Safety related documentation – including a safety checklist;

2.4 Programme of implementation: To include controls and validity checks;

2.5 Oversight: Review and audits.

3 Criteria for the establishment of a Safety Case.

3.1 The Safety Case should:

- a. Be able to demonstrate that the required or equivalent level of safety is maintained throughout all phases of the programme, including as required by paragraph (c) below;
- b. Be valid to the application and the proposed operation (ATQP);
- c. Be adequately safe and ensure the required regulatory safety standards or approved equivalent safety standards are achieved;
- d. Be applicable over the entire lifetime of the programme;
- e. Demonstrate Completeness and Credibility of the programme;
- f. Be fully documented;
- g. Ensure integrity of the operation and the maintenance of the operations and training infra-structure;
- h. Ensure robustness to system change;
- i. Address the impact of technological advance, obsolescence and change;
- j. Address the impact of regulatory change.

4 In accordance with paragraph (c) the operator may develop an equivalent method other than that specified above.

**Comment:**

OR.OPS.145.FC adequately addresses the requirements of EU-OPS 1.965 but there is no specific recognition of the enhanced OPC, Line Check and SEP validity periods as currently prescribed in EU-OPS 1.978.

The alternative schedule for checking provided in EU-OPS 1.978 is integral to the benefits of allowing Operators to provide valuable additional Operator Specific Training. The removal of this specific recognition appears to be an unintentional omission on EASA's part and seemingly with no safety justification. We cannot believe that it is the intention of EASA to discontinue the current ATQP arrangements for Operators who already have sought and gained approval for an ATQP programme having already demonstrated that they meet the requirements of EU-OPS 1.978 and the associated AMC.

**Proposal:**

Include the following new AMC material based on Appendix 1 to EU-OPS 1.978 and the associated guidance material in JAA TGL 44 to complement the new regulation OR.OPS.150.FC (see previous comment on OR OPS 145 FC)

**AMC OR.OPS.150.FC - Alternative training and qualification programme**  
**(a) An operator's ATQP may apply to the following requirements that relate to training and qualifications:**

1. *Low Visibility Operations – Training and Qualifications.*
2. *Conversion training and checking.*
3. *Differences training and familiarisation training.*
4. *Nomination as commander.*
5. *Recurrent training and checking.*
6. *Operation on more than one type or variant.*

**(b) Components of the ATQP – an alternative training and qualification programme shall comprise the following:**

1. *Documentation that details the scope and requirements of the programme;*
2. *A task analysis to determine the tasks to be analysed in terms of:*
  - (i) *knowledge;*
  - (ii) *the required skills;*
  - (iii) *the associated skill based training;**and, where appropriate*
  - (iv) *the validated behavioural markers.*
3. *Curricula — the curriculum structure and content shall be determined by task analysis, and shall include proficiency objectives including when and how those objectives shall be met. The process for curriculum development shall be acceptable to the Authority;*
4. *A specific training programme for:*
  - (i) *each aeroplane type/class within the ATQP;*
  - (ii) *the instructors (Class rating instructor rating/Synthetic flight instructor authorisation/Type rating instructor rating — CRI/SFI/TRI), and other personnel undertaking flight crew instruction;*
  - (iii) *the examiners (Class rating examiner/Synthetic flight examiner/Type rating examiner — CRE/SFE/TRE); to include a method for the standardisation of the instructors and examiners;*
5. *A feedback loop for the purpose of curriculum validation and refinement, and to ascertain that the programme meets its proficiency objectives;*
6. *A method for the assessment of flight crew both during conversion and*

recurrent training and checking. The assessment process shall include event-based assessment as part of the LOE. The method of assessment shall comply with the provisions of OPS 1.965;

7. An integrated system of quality control, that ensures compliance with all the requirements processes and procedures of the programme;

8. A process that describes the method to be used if the monitoring and evaluation programmes do not ensure compliance with the established proficiency and qualification standards for flight crew;

9. A data monitoring/analysis programme.

**(c) Implementation**

The operator shall develop an evaluation and implementation strategy acceptable to the Authority;

the following requirements shall be fulfilled:

1. The implementation process shall include the following stages:

(i) a safety case that substantiates the validity of:

(A) the revised training and qualification standards when compared with the standards achieved under OR.OPS prior to the introduction of ATQP.

(B) any new training methods implemented as part of ATQP.

If approved by the Authority the operator may establish an equivalent method other than a formal safety case.

(ii) Undertake a task analysis as required by paragraph (b)2 above in order to establish the operator's programme of targeted training and the associated training objectives.

(iii) A period of operation whilst data is collected and analysed to ensure the efficacy of the safety case or equivalent and validate the task analysis. During this period the operator shall continue to operate to the pre-ATQP OR.OPS requirements. The length of this period shall be agreed with the authority;

2. The operator may then be approved to conduct training and qualification as specified under the ATQP.

**(d) Terminology**

1 Line Oriented Evaluation (LOE). LOE is an evaluation methodology used in the ATQP to evaluate

trainee performance, and to validate trainee proficiency. LOEs consist of flight simulator scenarios that are developed by the operator in accordance with a methodology approved as part of the ATQP. The LOE should be realistic and include appropriate weather scenarios and in addition should fall within an acceptable range of difficulty. The LOE should include the use of validated event sets to provide the basis for event based assessment. See paragraph 4 below.

2 Line Oriented Quality Evaluation (LOQE). LOQE is one of the tools used to help evaluate the overall performance of an operation. LOQEs consist of line flights that are observed by appropriately qualified operator personnel to provide feedback to validate the ATQP. The LOQE should be designed to look at those elements of the operation that are unable to be monitored by FDM or Advanced FDM programmes.

3 Skill based training. Skill based training requires the identification of specific knowledge and skills.

The required knowledge and skills are identified within an ATQP as part of a task analysis and are used to provide targeted training.

4 Event based Assessment. This is the assessment of flight crew to provide assurance that the required knowledge and skills have been acquired. This is achieved within an LOE. Feedback to the flight crew is an integral part of event based assessment.]

**(e) Requirements, Scope and Documentation of the Programme**

The documentation should demonstrate how the operator should establish the scope and requirements of the programme. The documentation should include:

1 How the ATQP should enable the operator to establish an alternative training programme that substitutes the requirements as listed in OR-OPS. The

*programme should demonstrate that the operator is able to improve the training and qualification standards of flight crew to a level that exceeds the standard prescribed in OR-OPS.*

*2 The operator's training needs and established operational and training objectives.*

*3 How the operator defines the process for designing of and gaining approval for the operator's flight crew qualification programmes. This should include quantified operational and training objectives identified by the operator's internal monitoring programmes. External sources may also be used.*

*4 How the programme will:*

- a. Enhance safety;*
- b. Improve training and qualification standards of flight crew;*
- c. Establish attainable training objectives;*
- d. Integrate CRM in all aspects of training;*
- e. Develop a support and feedback process to form a self-correcting training system;*
- f. Institute a system of progressive evaluations of all training to enable consistent and uniform monitoring of the training undertaken by flight crew;*
- g. Enable the operator to be able to respond to the new aeroplane technologies and changes in the operational environment;*
- h. Foster the use of innovative training methods and technology for flight crew instruction and the evaluation of training systems;*
- i. Make efficient use of training resources, specifically to match the use of training media to the training needs.*

***(f) Task Analysis***

*For each aeroplane type/class to be included within the ATQP the operator should establish a systematic review that determines and defines the various tasks to be undertaken by the flight crew when operating that type(s)/class. Data from other types/class may also be used. The analysis should determine and describe the knowledge and skills required to complete the various tasks specific to the aeroplane type/class and/or type of operation. In addition the analysis should identify the appropriate behavioural markers that should be exhibited. The task analysis should be suitably validated in accordance with paragraph (c)(iii). The task analysis, in conjunction with the data gathering programme(s) permit the operator to establish a programme of targeted training together with the associated training objectives described in paragraph (g) below.*

***(g) Training Programme***

*The training programme should have the following structure:*

*1 Curriculum.*

*1.1 Daily lesson plan.*

*2 The curriculum should specify the following elements:*

*2.1 Entry requirements: A list of topics and content, describing what training level will be required before start or continuation of training.*

*2.2 Topics: A description of what will be trained during the lesson;*

*2.3 Targets/Objectives*

*a. Specific target or set of targets that have to be reached and fulfilled before the training course can be continued.*

*b. Each specified target should have an associated objective that is identifiable both by the flight crew and the trainers.*

*c. Each qualification event that is required by the programme should specify the training that is required to be undertaken and the required standard to be achieved. (See paragraph j below)*

*3 Each lesson/course/training or qualification event should have the same basic structure. The topics related to the lesson have to be listed and the lesson targets should be unambiguous.*

*4 Each lesson/course or training event whether classroom, CBT or simulator*

should specify the required topics with the relevant targets to be achieved.

**(h) Training Personnel**

1 Personnel who perform training and checking of flight crew in an operator's ATQP should receive the following additional training on:

- 1.1 ATQP principles and goals;
- 1.2 Knowledge/skills/behaviour as learned from task analysis;
- 1.3 LOE/ LOFT Scenarios to include triggers / markers / event sets / observable behaviour;
- 1.4 Qualification standards;
- 1.5 Harmonisation of assessment standards;
- 1.6 Behavioural markers and the systemic assessment of CRM;
- 1.7 Event sets and the corresponding desired knowledge/skills and behaviour of the flight crew;
- 1.8 The processes that the operator has implemented to validate the training and qualification standards and the instructors part in the ATQP quality control; and
- 1.9 LOQE.

**(i) Feedback Loop**

1 The feedback should be used as a tool to validate that the curricula are implemented as specified by the ATQP; this enables substantiation of the curriculum, and that proficiency and training objectives have been met. The feedback loop should include data from operations flight data monitoring, advanced FDM programme and LOE/LOQE programmes. In addition the evaluation process shall describe whether the overall targets/objectives of training are being achieved and shall prescribe any corrective action that needs to be undertaken.

2 The programmes established quality control mechanisms should at least review the following:

- 2.1 Procedures for approval of recurrent training;
- 2.2 ATQP instructor training approvals;
- 2.3 Approval of event set(s) for LOE/LOFT;
- 2.4 Procedures for conducting LOE and LOQE.

**(j) Crew Performance Measurement and Evaluation**

1 The qualification and checking programmes should include at least the following elements:

- 1.1 A specified structure;
- 1.2 Elements to be tested/examined;
- 1.3 Targets and/or standards to be attained;
- 1.4 The specified technical and procedural knowledge and skills, and behavioural markers to be exhibited.

2 An LOE event should comprise of tasks and sub-tasks performed by the crew under a specified set of conditions. Each event has one or more specific training targets/objectives, which require the performance of a specific manoeuvre, the application of procedures, or the opportunity to practise cognitive, communication or other complex skills. For each event the proficiency that is required to be achieved should be established. Each event should include a range of circumstances under which the crews' performance is to be measured and evaluated. The conditions pertaining to each event should also be established and they may include the prevailing meteorological conditions (ceiling, visibility, wind, turbulence etc.); the operational environment (navigation aid inoperable etc.); and the operational contingencies (non-normal operation etc).

3 The markers specified under the operator's ATQP should form one of the core elements in determining the required qualification standard. A typical set of markers are shown in the table below:

EVENT	MARKER
-------	--------

Awareness	1 Monitors and reports changes in automation status.
of Aeroplane Systems:	2 Applies closed loop principle in all relevant situations.
	3 Uses all channels for updates.
	4 Is aware of remaining technical resources

4 The topics / targets integrated into the curriculum have to be measurable and progression on any training/course is only allowed if the targets are fulfilled.

**(k) Data Monitoring/Analysis Programme**

1 The data analysis programme should consist of:

1.1 A Flight Data Monitoring (FDM) programme: This programme should include systematic evaluation of operational data derived from equipment that is able to record the flight profile and relevant operational information during flights conducted by the operator's aeroplane. Data collection should reach a minimum of 60% of all relevant flights conducted by the operator before ATQP approval is granted. This proportion may be increased at the discretion of the Authority.

1.2 An Advanced FDM when an extension to the ATQP is requested: An advanced FDM programme is determined by the level of integration with other safety initiatives implemented by the operator, such as the operator's Quality System. The programme should include both systematic evaluations of data from an FDM programme and flight crew training events for the relevant crews. Data collection should reach a minimum of 80% of all relevant flights and training conducted by the operator. This proportion may be varied at the discretion of the Authority.

2 The purpose of either an FDM or advanced FDM programme is to enable the operator to:

2.1 Provide data to support the programme's implementation and justify any changes to the ATQP;

2.2 Establish operational and training objectives based upon an analysis of the operational environment;

2.3 Monitor the effectiveness of flight crew training and qualification.

3 Data Gathering.

3.1 FDM programmes should include a system that captures flight data, and then transforms the data into an appropriate format for analysis. The programme should generate information to assist the operations safety personnel in analysing the data. The analysis should be made available to the ATQP postholder.

3.2 The data gathered should:

a. Include all fleets that plan to operate under the ATQP;

b. Include all crews trained and qualified under the ATQP;

c. Be established during the implementation phase of ATQP; and

d. Continue throughout the life of the ATQP.

4 Data Handling.

4.1 The operator should establish a process, which ensures the strict adherence to any data handling protocols, agreed with flight crew representative bodies, to ensure the confidentiality of individual flight crew members.

4.2 The data handling protocol should define the maximum period of time that detailed FDM or advanced FDM programme data, including exceedences, should be retained. Trend data may be retained permanently.

5 An operator that has an acceptable operations flight data monitoring programme prior to the proposed introduction of ATQP may, with the approval of the Authority, use relevant data from other fleets not part of the proposed ATQP.

**(l) Safety Case**

1.1 A documented body of evidence that provides a demonstrable and valid justification that the programme (ATQP) is adequately safe for the given type of operation. The safety case should encompass each phase of implementation of the programme and be applicable over the lifetime of the programme that is to

be overseen.

1.2 The safety case should:

- a. Demonstrate the required level of safety;
- b. Ensure the required safety is maintained throughout the lifetime of the programme;
- c. Minimise risk during all phases of the programmes implementation and operation.

2 Elements of a Safety Case:

2.1 Planning: Integrated and planned with the operation (ATQP) that is to be justified;

2.2 Criteria: Develop the applicable criteria - see paragraph 3 below;

2.3 Documentation: Safety related documentation – including a safety checklist;

2.4 Programme of implementation: To include controls and validity checks;

2.5 Oversight: Review and audits.

3 Criteria for the establishment of a Safety Case.

3.1 The Safety Case should:

- a. Be able to demonstrate that the required or equivalent level of safety is maintained throughout all phases of the programme, including as required by paragraph (c) below;
- b. Be valid to the application and the proposed operation (ATQP);
- c. Be adequately safe and ensure the required regulatory safety standards or approved equivalent safety standards are achieved;
- d. Be applicable over the entire lifetime of the programme;
- e. Demonstrate Completeness and Credibility of the programme;
- f. Be fully documented;
- g. Ensure integrity of the operation and the maintenance of the operations and training infra-structure;
- h. Ensure robustness to system change;
- i. Address the impact of technological advance, obsolescence and change;
- j. Address the impact of regulatory change.

4 In accordance with paragraph (c) the operator may develop an equivalent method other than that specified above.

Comment

The text relating to the new requirement for First Aid to be included in Triennial Training is very vague. Does this apply to a medium or large MPA with 4 or more cabin crew members?

comment

2312

comment by: *Ryanair*

Comment ref 4.2 page 92

This text, in the Section titled Recurrent Training and Checking, states that flying training must be carried out by a TRI.

Please confirm that this is the intended effect of the text. If so, this will prevent a pilot who has failed a Line check from being re-trained by a Line Training Captain (LTC) before being re-checked. This imposes an un-necessary expense on an operator as a TRI(A) is a much rarer resource than an LTC. LTCs have completed this type of activity for decades.

Please confirm that this requirement only applies to flying training associated with Recurrent Training and Checking (if that is the intention).

Please confirm that line flying training following an Operator's Conversion Course or a Type Rating may be conducted by an LTC **AFTER** the student has done the required 4 or 6 landings (type rating only) following a type rating which, of course, would be conducted by a TRI(A).

This text has far reaching consequences relating to the resources required to conduct conversion line flying training and consequently will impose a very significant cost if implemented. It is not clear what, if any, increase in safety margins will be achieved by this measure if enacted.

**Comment:**

OR.OPS.145.FC adequately addresses the requirements of EU-OPS 1.965 but there is no specific recognition of the enhanced OPC, Line Check and SEP validity periods as currently prescribed in EU-OPS 1.978.

The alternative schedule for checking provided in EU-OPS 1.978 is integral to the benefits of allowing Operators to provide valuable additional Operator

Specific Training. The removal of this specific recognition appears to be an unintentional omission on EASA's part and seemingly with no safety justification.

We cannot believe that it is the intention of EASA to discontinue the current ATQP arrangements for Operators who already have sought and gained approval for an ATQP programme having already demonstrated that they meet the requirements of EU-OPS 1.978 and the associated AMC.

**Proposal:**

Include the following new AMC material based on Appendix 1 to EU-OPS 1.978 and the associated guidance material in JAA TGL 44 to complement the new regulation OR.OPS.150.FC (see comment xxx)

AMC OR.OPS.150.FC - Alternative training and qualification programme

(a) An operator's ATQP may apply to the following requirements that relate to training and qualifications:

1. Low Visibility Operations – Training and Qualifications.
2. Conversion training and checking.
3. Differences training and familiarisation training.
4. Nomination as commander.
5. Recurrent training and checking.
6. Operation on more than one type or variant.

(b) Components of the ATQP — an alternative training and qualification programme shall comprise the following:

1. Documentation that details the scope and requirements of the programme;
2. A task analysis to determine the tasks to be analysed in terms of:
  - (i) knowledge;
  - (ii) the required skills;
  - (iii) the associated skill based training;
 and, where appropriate
  - (iv) the validated behavioural markers.
3. Curricula — the curriculum structure and content shall be determined by task analysis, and shall include proficiency objectives including when and how those objectives shall be met. The process for curriculum development shall be acceptable to the Authority;
4. A specific training programme for:
  - (i) each aeroplane type/class within the ATQP;
  - (ii) the instructors (Class rating instructor rating/Synthetic flight instructor authorisation/Type rating instructor rating — CRI/SFI/TRI), and other personnel undertaking flight crew instruction;
  - (iii) the examiners (Class rating examiner/Synthetic flight examiner/Type rating examiner — CRE/SFE/TRE); to include a method for the standardisation of the instructors and examiners;
5. A feedback loop for the purpose of curriculum validation and refinement, and to ascertain that the programme meets its proficiency objectives;
6. A method for the assessment of flight crew both during conversion and recurrent training and checking. The assessment process shall include event-based assessment as part of the LOE. The method of assessment shall comply with the provisions of OPS 1.965;
7. An integrated system of quality control, that ensures compliance with all the requirements processes and procedures of the programme;
8. A process that describes the method to be used if the monitoring and evaluation programmes do not ensure compliance with the established proficiency and qualification standards for flight crew;

## 9. A data monitoring/analysis programme.

### (c) Implementation

The operator shall develop an evaluation and implementation strategy acceptable to the Authority;

the following requirements shall be fulfilled:

1. The implementation process shall include the following stages:

(i) a safety case that substantiates the validity of:

(A) the revised training and qualification standards when compared with the standards achieved under OR.OPS prior to the introduction of ATQP.

(B) any new training methods implemented as part of ATQP.

If approved by the Authority the operator may establish an equivalent method other than a formal safety case.

(ii) Undertake a task analysis as required by paragraph (b)2 above in order to establish the operator's programme of targeted training and the associated training objectives.

(iii) A period of operation whilst data is collected and analysed to ensure the efficacy of the safety case or equivalent and validate the task analysis. During this period the operator shall continue to operate to the pre-ATQP OR.OPS requirements. The length of this period shall be agreed with the authority;

2. The operator may then be approved to conduct training and qualification as specified under the ATQP.

### (d) Terminology

1 Line Oriented Evaluation (LOE). LOE is an evaluation methodology used in the ATQP to evaluate trainee performance, and to validate trainee proficiency. LOEs consist of flight simulator scenarios that are developed by the operator in accordance with a methodology approved as part of the ATQP. The LOE should be realistic and include appropriate weather scenarios and in addition should fall within an acceptable range of difficulty. The LOE should include the use of validated event sets to provide the basis for event based assessment. See paragraph 4 below.

2 Line Oriented Quality Evaluation (LOQE). LOQE is one of the tools used to help evaluate the overall performance of an operation. LOQEs consist of line flights that are observed by appropriately qualified operator personnel to provide feedback to validate the ATQP. The LOQE should be designed to look at those elements of the operation that are unable to be monitored by FDM or Advanced FDM programmes.

3 Skill based training. Skill based training requires the identification of specific knowledge and skills.

The required knowledge and skills are identified within an ATQP as part of a task analysis and are used to provide targeted training.

4 Event based Assessment. This is the assessment of flight crew to provide assurance that the required knowledge and skills have been acquired. This is achieved within an LOE. Feedback to the flight crew is an integral part of event based assessment.]

### (e) Requirements, Scope and Documentation of the Programme

The documentation should demonstrate how the operator should establish the scope and requirements of the programme. The documentation should include:

1 How the ATQP should enable the operator to establish an alternative training programme that substitutes the requirements as listed in OR-OPS. The programme should demonstrate that the operator is able to improve the training

and qualification standards of flight crew to a level that exceeds the standard prescribed in OR-OPS.

2 The operator's training needs and established operational and training objectives.

3 How the operator defines the process for designing of and gaining approval for the operator's flight crew qualification programmes. This should include quantified operational and training objectives identified by the operator's internal monitoring programmes. External sources may also be used.

4 How the programme will:

- a. Enhance safety;
- b. Improve training and qualification standards of flight crew;
- c. Establish attainable training objectives;
- d. Integrate CRM in all aspects of training;
- e. Develop a support and feedback process to form a self-correcting training system;
- f. Institute a system of progressive evaluations of all training to enable consistent and uniform monitoring of the training undertaken by flight crew;
- g. Enable the operator to be able to respond to the new aeroplane technologies and changes in the operational environment;
- h. Foster the use of innovative training methods and technology for flight crew instruction and the evaluation of training systems;
- i. Make efficient use of training resources, specifically to match the use of training media to the training needs.

(f) Task Analysis

For each aeroplane type/class to be included within the ATQP the operator should establish a systematic review that determines and defines the various tasks to be undertaken by the flight crew when operating that type(s)/class. Data from other types/class may also be used. The analysis should determine and describe the knowledge and skills required to complete the various tasks specific to the aeroplane type/class and/or type of operation. In addition the analysis should identify the appropriate behavioural markers that should be exhibited. The task analysis should be suitably validated in accordance with paragraph (c)(iii). The task analysis, in conjunction with the data gathering programme(s) permit the operator to establish a programme of targeted training together with the associated training objectives described in paragraph (g) below.

(g) Training Programme

The training programme should have the following structure:

1 Curriculum.

1.1 Daily lesson plan.

2 The curriculum should specify the following elements:

2.1 Entry requirements: A list of topics and content, describing what training level will be required before start or continuation of training.

2.2 Topics: A description of what will be trained during the lesson;

2.3 Targets/Objectives

a. Specific target or set of targets that have to be reached and fulfilled before the training course can be continued.

b. Each specified target should have an associated objective that is identifiable both by the flight crew and the trainers.

c. Each qualification event that is required by the programme should specify the training that is required to be undertaken and the required standard to be

achieved. (See paragraph j below)

3 Each lesson/course/training or qualification event should have the same basic structure. The topics related to the lesson have to be listed and the lesson targets should be unambiguous.

4 Each lesson/course or training event whether classroom, CBT or simulator should specify the required topics with the relevant targets to be achieved.

(h) Training Personnel

1 Personnel who perform training and checking of flight crew in an operator's ATQP should receive the following additional training on:

1.1 ATQP principles and goals;

1.2 Knowledge/skills/behaviour as learned from task analysis;

1.3 LOE/ LOFT Scenarios to include triggers / markers / event sets / observable behaviour;

1.4 Qualification standards;

1.5 Harmonisation of assessment standards;

1.6 Behavioural markers and the systemic assessment of CRM;

1.7 Event sets and the corresponding desired knowledge/skills and behaviour of the flight crew;

1.8 The processes that the operator has implemented to validate the training and qualification standards and the instructors part in the ATQP quality control; and

1.9 LOQE.

(i) Feedback Loop

1 The feedback should be used as a tool to validate that the curricula are implemented as specified by the ATQP; this enables substantiation of the curriculum, and that proficiency and training objectives have been met. The feedback loop should include data from operations flight data monitoring, advanced FDM programme and LOE/LOQE programmes. In addition the evaluation process shall describe whether the overall targets/objectives of training are being achieved and shall prescribe any corrective action that needs to be undertaken.

2 The programmes established quality control mechanisms should at least review the following:

2.1 Procedures for approval of recurrent training;

2.2 ATQP instructor training approvals;

2.3 Approval of event set(s) for LOE/LOFT;

2.4 Procedures for conducting LOE and LOQE.

(j) Crew Performance Measurement and Evaluation

1 The qualification and checking programmes should include at least the following elements:

1.1 A specified structure;

1.2 Elements to be tested/examined;

1.3 Targets and/or standards to be attained;

1.4 The specified technical and procedural knowledge and skills, and behavioural markers to be exhibited.

2 An LOE event should comprise of tasks and sub-tasks performed by the crew under a specified set of conditions. Each event has one or more specific training targets/objectives, which require the performance of a specific manoeuvre, the application of procedures, or the opportunity to practise cognitive, communication or other complex skills. For each event the proficiency that is required to be achieved should be established. Each event should include a range of circumstances under which the crews' performance is to be measured and evaluated. The conditions pertaining to each event should also be

established and they may include the prevailing meteorological conditions (ceiling, visibility, wind, turbulence etc.); the operational environment (navigation aid inoperable etc.); and the operational contingencies (non-normal operation etc).

3 The markers specified under the operator's ATQP should form one of the core elements in determining the required qualification standard. A typical set of markers are shown in the table below:

<b>EVENT</b>	<b>MARKER</b>
Awareness	1 Monitors and reports changes in automation status.
of Aeroplane Systems:	2 Applies closed loop principle in all relevant situations.
	3 Uses all channels for updates.
	4 Is aware of remaining technical resources

4 The topics / targets integrated into the curriculum have to be measurable and progression on any training/course is only allowed if the targets are fulfilled.

#### (k) Data Monitoring/Analysis Programme

1 The data analysis programme should consist of:

1.1 A Flight Data Monitoring (FDM) programme: This programme should include systematic evaluation of operational data derived from equipment that is able to record the flight profile and relevant operational information during flights conducted by the operator's aeroplane. Data collection should reach a minimum of 60% of all relevant flights conducted by the operator before ATQP approval is granted. This proportion may be increased at the discretion of the Authority.

1.2 An Advanced FDM when an extension to the ATQP is requested: An advanced FDM programme is determined by the level of integration with other safety initiatives implemented by the operator, such as the operator's Quality System. The programme should include both systematic evaluations of data from an FDM programme and flight crew training events for the relevant crews. Data collection should reach a minimum of 80% of all relevant flights and training conducted by the operator. This proportion may be varied at the discretion of the Authority.

2 The purpose of either an FDM or advanced FDM programme is to enable the operator to:

- 2.1 Provide data to support the programme's implementation and justify any changes to the ATQP;
- 2.2 Establish operational and training objectives based upon an analysis of the operational environment;
- 2.3 Monitor the effectiveness of flight crew training and qualification.

3 Data Gathering.

3.1 FDM programmes should include a system that captures flight data, and then transforms the data into an appropriate format for analysis. The programme should generate information to assist the operations safety personnel in analysing the data. The analysis should be made available to the ATQP postholder.

3.2 The data gathered should:

- a. Include all fleets that plan to operate under the ATQP;
- b. Include all crews trained and qualified under the ATQP;
- c. Be established during the implementation phase of ATQP; and
- d. Continue throughout the life of the ATQP.

#### 4 Data Handling.

4.1 The operator should establish a process, which ensures the strict adherence to any data handling protocols, agreed with flight crew representative bodies, to ensure the confidentiality of individual flight crew members.

4.2 The data handling protocol should define the maximum period of time that detailed FDM or advanced FDM programme data, including exceedences, should be retained. Trend data may be retained permanently.

5 An operator that has an acceptable operations flight data monitoring programme prior to the proposed introduction of ATQP may, with the approval of the Authority, use relevant data from other fleets not part of the proposed ATQP.

#### (I) Safety Case

1.1 A documented body of evidence that provides a demonstrable and valid justification that the programme (ATQP) is adequately safe for the given type of operation. The safety case should encompass each phase of implementation of the programme and be applicable over the lifetime of the programme that is to be overseen.

1.2 The safety case should:

- a. Demonstrate the required level of safety;
- b. Ensure the required safety is maintained throughout the lifetime of the programme;
- c. Minimise risk during all phases of the programmes implementation and operation.

#### 2 Elements of a Safety Case:

2.1 Planning: Integrated and planned with the operation (ATQP) that is to be justified;

2.2 Criteria: Develop the applicable criteria - see paragraph 3 below;

2.3 Documentation: Safety related documentation – including a safety checklist;

2.4 Programme of implementation: To include controls and validity checks;

2.5 Oversight: Review and audits.

#### 3 Criteria for the establishment of a Safety Case.

3.1 The Safety Case should:

- a. Be able to demonstrate that the required or equivalent level of safety is maintained throughout all phases of the programme, including as required by paragraph (c) below;
- b. Be valid to the application and the proposed operation (ATQP);
- c. Be adequately safe and ensure the required regulatory safety standards or approved equivalent safety standards are achieved;
- d. Be applicable over the entire lifetime of the programme;
- e. Demonstrate Completeness and Credibility of the programme;
- f. Be fully documented;
- g. Ensure integrity of the operation and the maintenance of the operations and training infra-structure;
- h. Ensure robustness to system change;
- i. Address the impact of technological advance, obsolescence and change;
- j. Address the impact of regulatory change.

4 In accordance with paragraph (c) the operator may develop an equivalent method other than that specified above.

- comment 2461 comment by: KLM
- Relevant Text:**  
 1.2.3 Every 3 years the programme of training should include the following:  
 a. Actual operation of all types of exits;  
 b. Demonstration of the method used to operate a slide where fitted;  
 c. Actual fire-fighting using equipment representative of that carried in the aircraft on an actual or simulated fire;  
**Comment:**  
 An exception for Halon extinguisher is needed due to environmental protection  
**Proposal:**  
 c. Actual fire-fighting using equipment representative of that carried in the aircraft on an actual or simulated fire; except that with halon extinguishers, an alternative method may be used
- comment 2463 comment by: KLM
- Relevant Text:**  
 g. First aid, appropriate to the aircraft type, the kind of operation and crew complement.  
**Comment:**  
 Recurrent First Aid Training is a new requirement to flight crew. The form of appropriate training is not mentioned. For passenger operator Cabin crew members are trained to provide first aid  
**Proposal:**  
 Delete : g. First aid, appropriate to the aircraft type, the kind of operation and crew complement.
- comment 2464 comment by: KLM
- Relevant Text:**  
 2.3.7 Where a pilot is required to operate as pilot flying and pilot non-flying, he should be checked on one sector as pilot flying and on another sector as pilot non-flying.  
 However, where an operator's procedures require integrated flight preparation, integrated cockpit initialisation and that each pilot performs both flying and non-flying duties on the same sector, then the line check may be performed on a single sector.  
**Comment:**  
 Limiting the performance of single sector Line Checks to special operator's procedures is not reasonable. The regulator should aim for a level playing field.  
**Proposal:**  
 However, where an operator's procedures require integrated flight preparation, integrated cockpit initialisation, then the line check may be performed on a single sector, provided that each pilot performs both flying and non-flying duties on this sector
- comment 2467 comment by: KLM
- Comment:**  
 OR.OPS.145.FC adequately addresses the requirements of EU-OPS 1.965 but there is no specific recognition of the enhanced OPC, Line Check and SEP validity periods as currently prescribed in EU-OPS 1.978.  
 The alternative schedule for checking provided in EU-OPS 1.978 is integral to the benefits of allowing Operators to provide valuable additional Operator Specific Training. The removal of this specific recognition appears to be an

unintentional omission on EASA's part and seemingly with no safety justification.

We cannot believe that it is the intention of EASA to discontinue the current ATQP arrangements for Operators who already have sought and gained approval for an ATQP programme having already demonstrated that they meet the requirements of EU-OPS 1.978 and the associated AMC.

**Proposal:**

Include the following new AMC material based on Appendix 1 to EU-OPS 1.978 and the associated guidance material in JAA TGL 44 to complement the new regulation OR.OPS.150.FC (see previous comment on OR OPS 145 FC)

**AMC OR.OPS.150.FC - Alternative training and qualification programme**

**(a) An operator's ATQP may apply to the following requirements that relate to training and qualifications:**

1. *Low Visibility Operations – Training and Qualifications.*
2. *Conversion training and checking.*
3. *Differences training and familiarisation training.*
4. *Nomination as commander.*
5. *Recurrent training and checking.*
6. *Operation on more than one type or variant.*

**(b) Components of the ATQP – an alternative training and qualification programme shall comprise the following:**

1. *Documentation that details the scope and requirements of the programme;*
2. *A task analysis to determine the tasks to be analysed in terms of:*
  - (i) *knowledge;*
  - (ii) *the required skills;*
  - (iii) *the associated skill based training;**and, where appropriate*
  - (iv) *the validated behavioural markers.*
3. *Curricula — the curriculum structure and content shall be determined by task analysis, and shall include proficiency objectives including when and how those objectives shall be met. The process for curriculum development shall be acceptable to the Authority;*
4. *A specific training programme for:*
  - (i) *each aeroplane type/class within the ATQP;*
  - (ii) *the instructors (Class rating instructor rating/Synthetic flight instructor authorisation/Type rating instructor rating — CRI/SFI/TRI), and other personnel undertaking flight crew instruction;*
  - (iii) *the examiners (Class rating examiner/Synthetic flight examiner/Type rating examiner — CRE/SFE/TRE); to include a method for the standardisation of the instructors and examiners;*
5. *A feedback loop for the purpose of curriculum validation and refinement, and to ascertain that the programme meets its proficiency objectives;*
6. *A method for the assessment of flight crew both during conversion and recurrent training and checking. The assessment process shall include event-based assessment as part of the LOE. The method of assessment shall comply with the provisions of OPS 1.965;*
7. *An integrated system of quality control, that ensures compliance with all the requirements processes and procedures of the programme;*
8. *A process that describes the method to be used if the monitoring and evaluation programmes do not ensure compliance with the established proficiency and qualification standards for flight crew;*
9. *A data monitoring/analysis programme.*

**(c) Implementation**

*The operator shall develop an evaluation and implementation strategy acceptable to the Authority;*

*the following requirements shall be fulfilled:*

1. *The implementation process shall include the following stages:*
  - (i) *a safety case that substantiates the validity of:*
    - (A) *the revised training and qualification standards when compared with the standards achieved under OR.OPS prior to the introduction of ATQP.*
    - (B) *any new training methods implemented as part of ATQP.*

*If approved by the Authority the operator may establish an equivalent method other than a formal safety case.*
  - (ii) *Undertake a task analysis as required by paragraph (b)2 above in order to establish the operator's programme of targeted training and the associated training objectives.*
  - (iii) *A period of operation whilst data is collected and analysed to ensure the efficacy of the safety case or equivalent and validate the task analysis. During this period the operator shall continue to operate to the pre-ATQP OR.OPS requirements. The length of this period shall be agreed with the authority;*
2. *The operator may then be approved to conduct training and qualification as specified under the ATQP.*

**(d) Terminology**

*1 Line Oriented Evaluation (LOE). LOE is an evaluation methodology used in the ATQP to evaluate trainee performance, and to validate trainee proficiency. LOEs consist of flight simulator scenarios that are developed by the operator in accordance with a methodology approved as part of the ATQP. The LOE should be realistic and include appropriate weather scenarios and in addition should fall within an acceptable range of difficulty. The LOE should include the use of validated event sets to provide the basis for event based assessment. See paragraph 4 below.*

*2 Line Oriented Quality Evaluation (LOQE). LOQE is one of the tools used to help evaluate the overall performance of an operation. LOQEs consist of line flights that are observed by appropriately qualified operator personnel to provide feedback to validate the ATQP. The LOQE should be designed to look at those elements of the operation that are unable to be monitored by FDM or Advanced FDM programmes.*

*3 Skill based training. Skill based training requires the identification of specific knowledge and skills.*

*The required knowledge and skills are identified within an ATQP as part of a task analysis and are used to provide targeted training.*

*4 Event based Assessment. This is the assessment of flight crew to provide assurance that the required knowledge and skills have been acquired. This is achieved within an LOE. Feedback to the flight crew is an integral part of event based assessment.]*

**(e) Requirements, Scope and Documentation of the Programme**

*The documentation should demonstrate how the operator should establish the scope and requirements of the programme. The documentation should include:*

*1 How the ATQP should enable the operator to establish an alternative training programme that substitutes the requirements as listed in OR-OPS. The programme should demonstrate that the operator is able to improve the training and qualification standards of flight crew to a level that exceeds the standard prescribed in OR-OPS.*

*2 The operator's training needs and established operational and training objectives.*

*3 How the operator defines the process for designing of and gaining approval for the operator's flight crew qualification programmes. This should include quantified operational and training objectives identified by the operator's internal monitoring programmes. External sources may also be used.*

*4 How the programme will:*

- a. Enhance safety;*
- b. Improve training and qualification standards of flight crew;*
- c. Establish attainable training objectives;*

- d. Integrate CRM in all aspects of training;*
- e. Develop a support and feedback process to form a self-correcting training system;*
- f. Institute a system of progressive evaluations of all training to enable consistent and uniform monitoring of the training undertaken by flight crew;*
- g. Enable the operator to be able to respond to the new aeroplane technologies and changes in the operational environment;*
- h. Foster the use of innovative training methods and technology for flight crew instruction and the evaluation of training systems;*
- i. Make efficient use of training resources, specifically to match the use of training media to the training needs.*

**(f) Task Analysis**

*For each aeroplane type/class to be included within the ATQP the operator should establish a systematic review that determines and defines the various tasks to be undertaken by the flight crew when operating that type(s)/class. Data from other types/class may also be used. The analysis should determine and describe the knowledge and skills required to complete the various tasks specific to the aeroplane type/class and/or type of operation. In addition the analysis should identify the appropriate behavioural markers that should be exhibited. The task analysis should be suitably validated in accordance with paragraph (c)(iii). The task analysis, in conjunction with the data gathering programme(s) permit the operator to establish a programme of targeted training together with the associated training objectives described in paragraph (g) below.*

**(g) Training Programme**

*The training programme should have the following structure:*

*1 Curriculum.*

*1.1 Daily lesson plan.*

*2 The curriculum should specify the following elements:*

*2.1 Entry requirements: A list of topics and content, describing what training level will be required before start or continuation of training.*

*2.2 Topics: A description of what will be trained during the lesson;*

*2.3 Targets/Objectives*

*a. Specific target or set of targets that have to be reached and fulfilled before the training course can be continued.*

*b. Each specified target should have an associated objective that is identifiable both by the flight crew and the trainers.*

*c. Each qualification event that is required by the programme should specify the training that is required to be undertaken and the required standard to be achieved. (See paragraph j below)*

*3 Each lesson/course/training or qualification event should have the same basic structure. The topics related to the lesson have to be listed and the lesson targets should be unambiguous.*

*4 Each lesson/course or training event whether classroom, CBT or simulator should specify the required topics with the relevant targets to be achieved.*

**(h) Training Personnel**

*1 Personnel who perform training and checking of flight crew in an operator's ATQP should receive the following additional training on:*

*1.1 ATQP principles and goals;*

*1.2 Knowledge/skills/behaviour as learned from task analysis;*

*1.3 LOE/ LOFT Scenarios to include triggers / markers / event sets / observable behaviour;*

*1.4 Qualification standards;*

*1.5 Harmonisation of assessment standards;*

*1.6 Behavioural markers and the systemic assessment of CRM;*

*1.7 Event sets and the corresponding desired knowledge/skills and behaviour of the flight crew;*

1.8 The processes that the operator has implemented to validate the training and qualification standards and the instructors part in the ATQP quality control; and

1.9 LOQE.

**(i) Feedback Loop**

1 The feedback should be used as a tool to validate that the curricula are implemented as specified by the ATQP; this enables substantiation of the curriculum, and that proficiency and training objectives have been met. The feedback loop should include data from operations flight data monitoring, advanced FDM programme and LOE/LOQE programmes. In addition the evaluation process shall describe whether the overall targets/objectives of training are being achieved and shall prescribe any corrective action that needs to be undertaken.

2 The programmes established quality control mechanisms should at least review the following:

2.1 Procedures for approval of recurrent training;

2.2 ATQP instructor training approvals;

2.3 Approval of event set(s) for LOE/LOFT;

2.4 Procedures for conducting LOE and LOQE.

**(j) Crew Performance Measurement and Evaluation**

1 The qualification and checking programmes should include at least the following elements:

1.1 A specified structure;

1.2 Elements to be tested/examined;

1.3 Targets and/or standards to be attained;

1.4 The specified technical and procedural knowledge and skills, and behavioural markers to be exhibited.

2 An LOE event should comprise of tasks and sub-tasks performed by the crew under a specified set of conditions. Each event has one or more specific training targets/objectives, which require the performance of a specific manoeuvre, the application of procedures, or the opportunity to practise cognitive, communication or other complex skills. For each event the proficiency that is required to be achieved should be established. Each event should include a range of circumstances under which the crews' performance is to be measured and evaluated. The conditions pertaining to each event should also be established and they may include the prevailing meteorological conditions (ceiling, visibility, wind, turbulence etc.); the operational environment (navigation aid inoperable etc.); and the operational contingencies (non-normal operation etc).

3 The markers specified under the operator's ATQP should form one of the core elements in

determining the required qualification standard. A typical set of markers are shown in the table below:

<b>EVENT</b>	<b>MARKER</b>
Awareness	1 Monitors and reports changes in automation status.
of Aeroplane Systems:	2 Applies closed loop principle in all relevant situations.
	3 Uses all channels for updates.
	4 Is aware of remaining technical resources

4 The topics / targets integrated into the curriculum have to be measurable and progression on any

training/course is only allowed if the targets are fulfilled.

**(k) Data Monitoring/Analysis Programme**

1 The data analysis programme should consist of:

1.1 A Flight Data Monitoring (FDM) programme: This programme should include systematic evaluation of operational data derived from equipment that is able to record the flight profile and relevant operational information during

*flights conducted by the operator's aeroplane. Data collection should reach a minimum of 60% of all relevant flights conducted by the operator before ATQP approval is granted. This proportion may be increased at the discretion of the Authority.*

*1.2 An Advanced FDM when an extension to the ATQP is requested: An advanced FDM programme is determined by the level of integration with other safety initiatives implemented by the operator, such as the operator's Quality System. The programme should include both systematic evaluations of data from an FDM programme and flight crew training events for the relevant crews. Data collection should reach a minimum of 80% of all relevant flights and training conducted by the operator. This proportion may be varied at the discretion of the Authority.*

*2 The purpose of either an FDM or advanced FDM programme is to enable the operator to:*

*2.1 Provide data to support the programme's implementation and justify any changes to the ATQP;*

*2.2 Establish operational and training objectives based upon an analysis of the operational environment;*

*2.3 Monitor the effectiveness of flight crew training and qualification.*

*3 Data Gathering.*

*3.1 FDM programmes should include a system that captures flight data, and then transforms the data into an appropriate format for analysis. The programme should generate information to assist the operations safety personnel in analysing the data. The analysis should be made available to the ATQP postholder.*

*3.2 The data gathered should:*

*a. Include all fleets that plan to operate under the ATQP;*

*b. Include all crews trained and qualified under the ATQP;*

*c. Be established during the implementation phase of ATQP; and*

*d. Continue throughout the life of the ATQP.*

*4 Data Handling.*

*4.1 The operator should establish a process, which ensures the strict adherence to any data handling protocols, agreed with flight crew representative bodies, to ensure the confidentiality of individual flight crew members.*

*4.2 The data handling protocol should define the maximum period of time that detailed FDM or advanced FDM programme data, including exceedences, should be retained. Trend data may be retained permanently.*

*5 An operator that has an acceptable operations flight data monitoring programme prior to the proposed introduction of ATQP may, with the approval of the Authority, use relevant data from other fleets not part of the proposed ATQP.*

***(I) Safety Case***

*1.1 A documented body of evidence that provides a demonstrable and valid justification that the programme (ATQP) is adequately safe for the given type of operation. The safety case should encompass each phase of implementation of the programme and be applicable over the lifetime of the programme that is to be overseen.*

*1.2 The safety case should:*

*a. Demonstrate the required level of safety;*

*b. Ensure the required safety is maintained throughout the lifetime of the programme;*

*c. Minimise risk during all phases of the programmes implementation and operation.*

*2 Elements of a Safety Case:*

*2.1 Planning: Integrated and planned with the operation (ATQP) that is to be justified;*

*2.2 Criteria: Develop the applicable criteria - see paragraph 3 below;*

2.3 Documentation: Safety related documentation – including a safety checklist;  
 2.4 Programme of implementation: To include controls and validity checks;  
 2.5 Oversight: Review and audits.  
 3 Criteria for the establishment of a Safety Case.  
 3.1 The Safety Case should:  
 a. Be able to demonstrate that the required or equivalent level of safety is maintained throughout all phases of the programme, including as required by paragraph (c) below;  
 b. Be valid to the application and the proposed operation (ATQP);  
 c. Be adequately safe and ensure the required regulatory safety standards or approved equivalent safety standards are achieved;  
 d. Be applicable over the entire lifetime of the programme;  
 e. Demonstrate Completeness and Credibility of the programme;  
 f. Be fully documented;  
 g. Ensure integrity of the operation and the maintenance of the operations and training infra-structure;  
 h. Ensure robustness to system change;  
 i. Address the impact of technological advance, obsolescence and change;  
 j. Address the impact of regulatory change.  
 4 In accordance with paragraph (c) the operator may develop an equivalent method other than that specified above.

comment by: *Deutsche Lufthansa AG*

**Comment:**

OR.OPS.145.FC adequately addresses the requirements of EU-OPS 1.965 but there is no specific recognition of the enhanced OPC, Line Check and SEP validity periods as currently prescribed in EU-OPS 1.978.

The alternative schedule for checking provided in EU-OPS 1.978 is integral to the benefits of allowing Operators to provide valuable additional Operator Specific Training. The removal of this specific recognition appears to be an unintentional omission on EASA's part and seemingly with no safety justification. We cannot believe that it is the intention of EASA to discontinue the current ATQP arrangements for Operators who already have sought and gained approval for an ATQP programme having already demonstrated that they meet the requirements of EU-OPS 1.978 and the associated AMC.

**Proposal:**

Include the following new AMC material based on Appendix 1 to EU-OPS 1.978 and the associated guidance material in JAA TGL 44 to complement the new regulation OR.OPS.150.FC (see previous comment on OR OPS 145 FC)

**AMC OR.OPS.150.FC - Alternative training and qualification programme**  
**(a) An operator's ATQP may apply to the following requirements that relate to training and qualifications:**

1. Low Visibility Operations – Training and Qualifications.
2. Conversion training and checking.
3. Differences training and familiarisation training.
4. Nomination as commander.
5. Recurrent training and checking.
6. Operation on more than one type or variant.

**(b) Components of the ATQP — an alternative training and qualification programme shall comprise the following:**

1. Documentation that details the scope and requirements of the programme;
2. A task analysis to determine the tasks to be analysed in terms of:
  - (i) knowledge;
  - (ii) the required skills;
  - (iii) the associated skill based training;
 and, where appropriate
  - (iv) the validated behavioural markers.
3. Curricula — the curriculum structure and content shall be determined by task analysis, and shall include proficiency objectives including when and how those objectives shall be met. The process for curriculum development shall be acceptable to the Authority;
4. A specific training programme for:
  - (i) each aeroplane type/class within the ATQP;
  - (ii) the instructors (Class rating instructor rating/Synthetic flight instructor authorisation/Type rating instructor rating — CRI/SFI/TRI), and other personnel undertaking flight crew instruction;
  - (iii) the examiners (Class rating examiner/Synthetic flight examiner/Type rating examiner — CRE/SFE/TRE); to include a method for the standardisation of the instructors and examiners;
5. A feedback loop for the purpose of curriculum validation and refinement, and to ascertain that the programme meets its proficiency objectives;
6. A method for the assessment of flight crew both during conversion and recurrent training and checking. The assessment process shall include event-based assessment as part of the LOE. The method of assessment shall comply with the provisions of OPS 1.965;
7. An integrated system of quality control, that ensures compliance with all the requirements processes and procedures of the programme;
8. A process that describes the method to be used if the monitoring and evaluation programmes do not ensure compliance with the established proficiency and qualification standards for flight crew;
9. A data monitoring/analysis programme.

**(c) Implementation**

The operator shall develop an evaluation and implementation strategy acceptable to the Authority;

the following requirements shall be fulfilled:

1. The implementation process shall include the following stages:
  - (i) a safety case that substantiates the validity of:
    - (A) the revised training and qualification standards when compared with the standards achieved under OR.OPS prior to the introduction of ATQP.
    - (B) any new training methods implemented as part of ATQP.
 If approved by the Authority the operator may establish an equivalent method other than a formal safety case.
  - (ii) Undertake a task analysis as required by paragraph (b)2 above in order to establish the operator's programme of targeted training and the associated training objectives.
  - (iii) A period of operation whilst data is collected and analysed to ensure the efficacy of the safety case or equivalent and validate the task analysis. During this period the operator shall continue to operate to the pre-ATQP OR.OPS requirements. The length of this period shall be agreed with the authority;
2. The operator may then be approved to conduct training and qualification as specified under the ATQP.

**(d) Terminology**

1 Line Oriented Evaluation (LOE). LOE is an evaluation methodology used in the ATQP to evaluate trainee performance, and to validate trainee proficiency. LOEs consist of flight

simulator scenarios that are developed by the operator in accordance with a methodology approved as part of the ATQP. The LOE should be realistic and include appropriate weather scenarios and in addition should fall within an acceptable range of difficulty. The LOE should include the use of validated event sets to provide the basis for event based assessment. See paragraph 4 below.

2 Line Oriented Quality Evaluation (LOQE). LOQE is one of the tools used to help evaluate the overall performance of an operation. LOQEs consist of line flights that are observed by appropriately qualified operator personnel to provide feedback to validate the ATQP. The LOQE should be designed to look at those elements of the operation that are unable to be monitored by FDM or Advanced FDM programmes.

3 Skill based training. Skill based training requires the identification of specific knowledge and skills.

The required knowledge and skills are identified within an ATQP as part of a task analysis and are used to provide targeted training.

4 Event based Assessment. This is the assessment of flight crew to provide assurance that the

required knowledge and skills have been acquired. This is achieved within an LOE. Feedback to the flight crew is an integral part of event based assessment.]

**(e) Requirements, Scope and Documentation of the Programme**

The documentation should demonstrate how the operator should establish the scope and

requirements of the programme. The documentation should include:

1 How the ATQP should enable the operator to establish an alternative training programme that substitutes the requirements as listed in OR-OPS. The programme should demonstrate that the operator is able to improve the training and qualification standards of flight crew to a level that exceeds the standard prescribed in OR-OPS.

2 The operator's training needs and established operational and training objectives.

3 How the operator defines the process for designing of and gaining approval for the operator's flight crew qualification programmes. This should include quantified operational and training objectives identified by the operator's internal monitoring programmes. External sources may also be used.

4 How the programme will:

a. Enhance safety;

b. Improve training and qualification standards of flight crew;

c. Establish attainable training objectives;

d. Integrate CRM in all aspects of training;

e. Develop a support and feedback process to form a self-correcting training system;

f. Institute a system of progressive evaluations of all training to enable consistent and uniform monitoring of the training undertaken by flight crew;

g. Enable the operator to be able to respond to the new aeroplane technologies and changes in the operational environment;

h. Foster the use of innovative training methods and technology for flight crew instruction and the evaluation of training systems;

i. Make efficient use of training resources, specifically to match the use of training media to the training needs.

**(f) Task Analysis**

For each aeroplane type/class to be included within the ATQP the operator should establish a systematic review that determines and defines the various tasks to be undertaken by the flight crew when operating that type(s)/class.

Data from other types/class may also be used. The analysis should determine and describe the knowledge and skills required to complete the various tasks specific to the aeroplane type/class and/or type of operation. In addition the analysis should identify the appropriate behavioural markers that should be

*exhibited. The task analysis should be suitably validated in accordance with paragraph (c)(iii). The task analysis, in conjunction with the data gathering programme(s) permit the operator to establish a programme of targeted training together with the associated training objectives described in paragraph (g) below.*

**(g) Training Programme**

*The training programme should have the following structure:*

*1 Curriculum.*

*1.1 Daily lesson plan.*

*2 The curriculum should specify the following elements:*

*2.1 Entry requirements: A list of topics and content, describing what training level will be required before start or continuation of training.*

*2.2 Topics: A description of what will be trained during the lesson;*

*2.3 Targets/Objectives*

*a. Specific target or set of targets that have to be reached and fulfilled before the training course can be continued.*

*b. Each specified target should have an associated objective that is identifiable both by the flight crew and the trainers.*

*c. Each qualification event that is required by the programme should specify the training that is required to be undertaken and the required standard to be achieved. (See paragraph j below)*

*3 Each lesson/course/training or qualification event should have the same basic structure. The topics related to the lesson have to be listed and the lesson targets should be unambiguous.*

*4 Each lesson/course or training event whether classroom, CBT or simulator should specify the required topics with the relevant targets to be achieved.*

**(h) Training Personnel**

*1 Personnel who perform training and checking of flight crew in an operator's ATQP should receive the following additional training on:*

*1.1 ATQP principles and goals;*

*1.2 Knowledge/skills/behaviour as learned from task analysis;*

*1.3 LOE/ LOFT Scenarios to include triggers / markers / event sets / observable behaviour;*

*1.4 Qualification standards;*

*1.5 Harmonisation of assessment standards;*

*1.6 Behavioural markers and the systemic assessment of CRM;*

*1.7 Event sets and the corresponding desired knowledge/skills and behaviour of the flight crew;*

*1.8 The processes that the operator has implemented to validate the training and qualification standards and the instructors part in the ATQP quality control; and*

*1.9 LOQE.*

**(i) Feedback Loop**

*1 The feedback should be used as a tool to validate that the curricula are implemented as specified by the ATQP; this enables substantiation of the curriculum, and that proficiency and training objectives have been met. The feedback loop should include data from operations flight data monitoring, advanced FDM programme and LOE/LOQE programmes. In addition the evaluation process shall describe whether the overall targets/objectives of training are being achieved and shall prescribe any corrective action that needs to be undertaken.*

*2 The programmes established quality control mechanisms should at least review the following:*

*2.1 Procedures for approval of recurrent training;*

*2.2 ATQP instructor training approvals;*

*2.3 Approval of event set(s) for LOE/LOFT;*

*2.4 Procedures for conducting LOE and LOQE.*

**(j) Crew Performance Measurement and Evaluation**

1 The qualification and checking programmes should include at least the following elements:

1.1 A specified structure;

1.2 Elements to be tested/examined;

1.3 Targets and/or standards to be attained;

1.4 The specified technical and procedural knowledge and skills, and behavioural markers to be exhibited.

2 An LOE event should comprise of tasks and sub-tasks performed by the crew under a specified set

of conditions. Each event has one or more specific training targets/objectives, which require the performance of a specific manoeuvre, the application of procedures, or the opportunity to practise cognitive, communication or other complex skills. For each event the proficiency that is required to be achieved should be established. Each event should include a range of circumstances under which the crews' performance is to be measured and evaluated. The conditions pertaining to each event should also be established and they may include the prevailing meteorological conditions (ceiling, visibility, wind, turbulence etc.); the operational environment (navigation aid inoperable etc.); and the operational contingencies (non-normal operation etc).

3 The markers specified under the operator's ATQP should form one of the core elements in determining the required qualification standard. A typical set of markers are shown in the table below:

<b>EVENT</b>	<b>MARKER</b>
Awareness	1 Monitors and reports changes in automation status.
of Aeroplane Systems:	2 Applies closed loop principle in all relevant situations.
	3 Uses all channels for updates.
	4 Is aware of remaining technical resources

4 The topics / targets integrated into the curriculum have to be measurable and progression on any

training/course is only allowed if the targets are fulfilled.

**(k) Data Monitoring/Analysis Programme**

1 The data analysis programme should consist of:

1.1 A Flight Data Monitoring (FDM) programme: This programme should include systematic evaluation of operational data derived from equipment that is able to record the flight profile and relevant operational information during flights conducted by the operator's aeroplane. Data collection should reach a minimum of 60% of all relevant flights conducted by the operator before ATQP approval is granted. This proportion may be increased at the discretion of the Authority.

1.2 An Advanced FDM when an extension to the ATQP is requested: An advanced FDM programme is determined by the level of integration with other safety initiatives implemented by the operator, such as the operator's Quality System. The programme should include both systematic evaluations of data from an FDM programme and flight crew training events for the relevant crews. Data collection should reach a minimum of 80% of all relevant flights and training conducted by the operator. This proportion may be varied at the discretion of the Authority.

2 The purpose of either an FDM or advanced FDM programme is to enable the operator to:

2.1 Provide data to support the programme's implementation and justify any changes to the ATQP;

2.2 Establish operational and training objectives based upon an analysis of the operational environment;

2.3 Monitor the effectiveness of flight crew training and qualification.

### *3 Data Gathering.*

*3.1 FDM programmes should include a system that captures flight data, and then transforms the data into an appropriate format for analysis. The programme should generate information to assist the operations safety personnel in analysing the data. The analysis should be made available to the ATQP postholder.*

*3.2 The data gathered should:*

- a. Include all fleets that plan to operate under the ATQP;*
- b. Include all crews trained and qualified under the ATQP;*
- c. Be established during the implementation phase of ATQP; and*
- d. Continue throughout the life of the ATQP.*

### *4 Data Handling.*

*4.1 The operator should establish a process, which ensures the strict adherence to any data handling protocols, agreed with flight crew representative bodies, to ensure the confidentiality of individual flight crew members.*

*4.2 The data handling protocol should define the maximum period of time that detailed FDM or advanced FDM programme data, including exceedences, should be retained. Trend data may be retained permanently.*

*5 An operator that has an acceptable operations flight data monitoring programme prior to the proposed introduction of ATQP may, with the approval of the Authority, use relevant data from other fleets not part of the proposed ATQP.*

### ***(I) Safety Case***

*1.1 A documented body of evidence that provides a demonstrable and valid justification that the programme (ATQP) is adequately safe for the given type of operation. The safety case should encompass each phase of implementation of the programme and be applicable over the lifetime of the programme that is to be overseen.*

*1.2 The safety case should:*

- a. Demonstrate the required level of safety;*
- b. Ensure the required safety is maintained throughout the lifetime of the programme;*
- c. Minimise risk during all phases of the programmes implementation and operation.*

*2 Elements of a Safety Case:*

*2.1 Planning: Integrated and planned with the operation (ATQP) that is to be justified;*

*2.2 Criteria: Develop the applicable criteria - see paragraph 3 below;*

*2.3 Documentation: Safety related documentation – including a safety checklist;*

*2.4 Programme of implementation: To include controls and validity checks;*

*2.5 Oversight: Review and audits.*

*3 Criteria for the establishment of a Safety Case.*

*3.1 The Safety Case should:*

- a. Be able to demonstrate that the required or equivalent level of safety is maintained throughout all phases of the programme, including as required by paragraph (c) below;*
- b. Be valid to the application and the proposed operation (ATQP);*
- c. Be adequately safe and ensure the required regulatory safety standards or approved equivalent safety standards are achieved;*
- d. Be applicable over the entire lifetime of the programme;*
- e. Demonstrate Completeness and Credibility of the programme;*
- f. Be fully documented;*
- g. Ensure integrity of the operation and the maintenance of the operations and training infra-structure;*
- h. Ensure robustness to system change;*
- i. Address the impact of technological advance, obsolescence and change;*
- j. Address the impact of regulatory change.*

4 In accordance with paragraph (c) the operator may develop an equivalent method other than that specified above.

**Comment:**

OR.OPS.145.FC adequately addresses the requirements of EU-OPS 1.965 but there is no specific recognition of the enhanced OPC, Line Check and SEP validity periods as currently prescribed in EU-OPS 1.978.

The alternative schedule for checking provided in EU-OPS 1.978 is integral to the benefits of allowing Operators to provide valuable additional Operator Specific Training. The removal of this specific recognition appears to be an unintentional omission on EASA's part and seemingly with no safety justification.

We cannot believe that it is the intention of EASA to discontinue the current ATQP arrangements for Operators who already have sought and gained approval for an ATQP programme having already demonstrated that they meet the requirements of EU-OPS 1.978 and the associated AMC.

**Proposal:**

Include the following new AMC material based on Appendix 1 to EU-OPS 1.978 and the associated guidance material in JAA TGL 44 to complement the new regulation OR.OPS.150.FC (see previous comment on OR OPS 145 FC)

**AMC OR.OPS.150.FC - Alternative training and qualification programme**

**(a) An operator's ATQP may apply to the following requirements that relate to training and qualifications:**

1. *Low Visibility Operations – Training and Qualifications.*
2. *Conversion training and checking.*
3. *Differences training and familiarisation training.*
4. *Nomination as commander.*
5. *Recurrent training and checking.*
6. *Operation on more than one type or variant.*

**(b) Components of the ATQP — an alternative training and qualification programme shall comprise the following:**

1. *Documentation that details the scope and requirements of the programme;*
2. *A task analysis to determine the tasks to be analysed in terms of:*
  - (i) *knowledge;*
  - (ii) *the required skills;*
  - (iii) *the associated skill based training;**and, where appropriate*
  - (iv) *the validated behavioural markers.*
3. *Curricula — the curriculum structure and content shall be determined by task analysis, and shall include proficiency objectives including when and how those objectives shall be met. The process for curriculum development shall be acceptable to the Authority;*
4. *A specific training programme for:*
  - (i) *each aeroplane type/class within the ATQP;*
  - (ii) *the instructors (Class rating instructor rating/Synthetic flight instructor authorisation/Type rating instructor rating — CRI/SFI/TRI), and other personnel undertaking flight crew instruction;*
  - (iii) *the examiners (Class rating examiner/Synthetic flight examiner/Type rating examiner — CRE/SFE/TRE); to include a method for the standardisation of the instructors and examiners;*
5. *A feedback loop for the purpose of curriculum validation and refinement, and to ascertain that the programme meets its proficiency objectives;*
6. *A method for the assessment of flight crew both during conversion and recurrent training and checking. The assessment process shall include event-*

based assessment as part of the LOE. The method of assessment shall comply with the provisions of OPS 1.965;

7. An integrated system of quality control, that ensures compliance with all the requirements processes and procedures of the programme;

8. A process that describes the method to be used if the monitoring and evaluation programmes do not ensure compliance with the established proficiency and qualification standards for flight crew;

9. A data monitoring/analysis programme.

**(c) Implementation**

The operator shall develop an evaluation and implementation strategy acceptable to the Authority;

the following requirements shall be fulfilled:

1. The implementation process shall include the following stages:

(i) a safety case that substantiates the validity of:

(A) the revised training and qualification standards when compared with the standards achieved under OR.OPS prior to the introduction of ATQP.

(B) any new training methods implemented as part of ATQP.

If approved by the Authority the operator may establish an equivalent method other than a formal safety case.

(ii) Undertake a task analysis as required by paragraph (b)2 above in order to establish the operator's programme of targeted training and the associated training objectives.

(iii) A period of operation whilst data is collected and analysed to ensure the efficacy of the safety case or equivalent and validate the task analysis. During this period the operator shall continue to operate to the pre-ATQP OR.OPS requirements. The length of this period shall be agreed with the authority;

2. The operator may then be approved to conduct training and qualification as specified under the ATQP.

**(d) Terminology**

1 Line Oriented Evaluation (LOE). LOE is an evaluation methodology used in the ATQP to evaluate

trainee performance, and to validate trainee proficiency. LOEs consist of flight simulator scenarios that are developed by the operator in accordance with a methodology approved as part of the ATQP. The LOE should be realistic and include appropriate weather scenarios and in addition should fall within an acceptable range of difficulty. The LOE should include the use of validated event sets to provide the basis for event based assessment. See paragraph 4 below.

2 Line Oriented Quality Evaluation (LOQE). LOQE is one of the tools used to help evaluate the overall performance of an operation. LOQEs consist of line flights that are observed by appropriately qualified operator personnel to provide feedback to validate the ATQP. The LOQE should be designed to look at those elements of the operation that are unable to be monitored by FDM or Advanced FDM programmes.

3 Skill based training. Skill based training requires the identification of specific knowledge and skills.

The required knowledge and skills are identified within an ATQP as part of a task analysis and are used to provide targeted training.

4 Event based Assessment. This is the assessment of flight crew to provide assurance that the required knowledge and skills have been acquired. This is achieved within an LOE. Feedback to the flight crew is an integral part of event based assessment.]

**(e) Requirements, Scope and Documentation of the Programme**

The documentation should demonstrate how the operator should establish the scope and requirements of the programme. The documentation should include:

1 How the ATQP should enable the operator to establish an alternative training programme that substitutes the requirements as listed in OR-OPS. The

programme should demonstrate that the operator is able to improve the training and qualification standards of flight crew to a level that exceeds the standard prescribed in OR-OPS.

2 The operator's training needs and established operational and training objectives.

3 How the operator defines the process for designing of and gaining approval for the operator's flight crew qualification programmes. This should include quantified operational and training objectives identified by the operator's internal monitoring programmes. External sources may also be used.

4 How the programme will:

- a. Enhance safety;
- b. Improve training and qualification standards of flight crew;
- c. Establish attainable training objectives;
- d. Integrate CRM in all aspects of training;
- e. Develop a support and feedback process to form a self-correcting training system;
- f. Institute a system of progressive evaluations of all training to enable consistent and uniform monitoring of the training undertaken by flight crew;
- g. Enable the operator to be able to respond to the new aeroplane technologies and changes in the operational environment;
- h. Foster the use of innovative training methods and technology for flight crew instruction and the evaluation of training systems;
- i. Make efficient use of training resources, specifically to match the use of training media to the training needs.

**(f) Task Analysis**

For each aeroplane type/class to be included within the ATQP the operator should establish a systematic review that determines and defines the various tasks to be undertaken by the flight crew when operating that type(s)/class. Data from other types/class may also be used. The analysis should determine and describe the knowledge and skills required to complete the various tasks specific to the aeroplane type/class and/or type of operation. In addition the analysis should identify the appropriate behavioural markers that should be exhibited. The task analysis should be suitably validated in accordance with paragraph (c)(iii). The task analysis, in conjunction with the data gathering programme(s) permit the operator to establish a programme of targeted training together with the associated training objectives described in paragraph (g) below.

**(g) Training Programme**

The training programme should have the following structure:

1 Curriculum.

1.1 Daily lesson plan.

2 The curriculum should specify the following elements:

2.1 Entry requirements: A list of topics and content, describing what training level will be required before start or continuation of training.

2.2 Topics: A description of what will be trained during the lesson;

2.3 Targets/Objectives

a. Specific target or set of targets that have to be reached and fulfilled before the training course can be continued.

b. Each specified target should have an associated objective that is identifiable both by the flight crew and the trainers.

c. Each qualification event that is required by the programme should specify the training that is required to be undertaken and the required standard to be achieved. (See paragraph j below)

3 Each lesson/course/training or qualification event should have the same basic structure. The topics related to the lesson have to be listed and the lesson targets should be unambiguous.

4 Each lesson/course or training event whether classroom, CBT or simulator

should specify the required topics with the relevant targets to be achieved.

**(h) Training Personnel**

1 Personnel who perform training and checking of flight crew in an operator's ATQP should receive the following additional training on:

- 1.1 ATQP principles and goals;
- 1.2 Knowledge/skills/behaviour as learned from task analysis;
- 1.3 LOE/ LOFT Scenarios to include triggers / markers / event sets / observable behaviour;
- 1.4 Qualification standards;
- 1.5 Harmonisation of assessment standards;
- 1.6 Behavioural markers and the systemic assessment of CRM;
- 1.7 Event sets and the corresponding desired knowledge/skills and behaviour of the flight crew;
- 1.8 The processes that the operator has implemented to validate the training and qualification standards and the instructors part in the ATQP quality control; and
- 1.9 LOQE.

**(i) Feedback Loop**

1 The feedback should be used as a tool to validate that the curricula are implemented as specified by the ATQP; this enables substantiation of the curriculum, and that proficiency and training objectives have been met. The feedback loop should include data from operations flight data monitoring, advanced FDM programme and LOE/LOQE programmes. In addition the evaluation process shall describe whether the overall targets/objectives of training are being achieved and shall prescribe any corrective action that needs to be undertaken.

2 The programmes established quality control mechanisms should at least review the following:

- 2.1 Procedures for approval of recurrent training;
- 2.2 ATQP instructor training approvals;
- 2.3 Approval of event set(s) for LOE/LOFT;
- 2.4 Procedures for conducting LOE and LOQE.

**(j) Crew Performance Measurement and Evaluation**

1 The qualification and checking programmes should include at least the following elements:

- 1.1 A specified structure;
- 1.2 Elements to be tested/examined;
- 1.3 Targets and/or standards to be attained;
- 1.4 The specified technical and procedural knowledge and skills, and behavioural markers to be exhibited.

2 An LOE event should comprise of tasks and sub-tasks performed by the crew under a specified set of conditions. Each event has one or more specific training targets/objectives, which require the performance of a specific manoeuvre, the application of procedures, or the opportunity to practise cognitive, communication or other complex skills. For each event the proficiency that is required to be achieved should be established. Each event should include a range of circumstances under which the crews' performance is to be measured and evaluated. The conditions pertaining to each event should also be established and they may include the prevailing meteorological conditions (ceiling, visibility, wind, turbulence etc.); the operational environment (navigation aid inoperable etc.); and the operational contingencies (non-normal operation etc).

3 The markers specified under the operator's ATQP should form one of the core elements in determining the required qualification standard. A typical set of markers are shown in the table below:

EVENT	MARKER
-------	--------

Awareness	1 Monitors and reports changes in automation status.
of Aeroplane Systems:	2 Applies closed loop principle in all relevant situations.
	3 Uses all channels for updates.
	4 Is aware of remaining technical resources

4 The topics / targets integrated into the curriculum have to be measurable and progression on any training/course is only allowed if the targets are fulfilled.

**(k) Data Monitoring/Analysis Programme**

1 The data analysis programme should consist of:

1.1 A Flight Data Monitoring (FDM) programme: This programme should include systematic evaluation of operational data derived from equipment that is able to record the flight profile and relevant operational information during flights conducted by the operator's aeroplane. Data collection should reach a minimum of 60% of all relevant flights conducted by the operator before ATQP approval is granted. This proportion may be increased at the discretion of the Authority.

1.2 An Advanced FDM when an extension to the ATQP is requested: An advanced FDM programme is determined by the level of integration with other safety initiatives implemented by the operator, such as the operator's Quality System. The programme should include both systematic evaluations of data from an FDM programme and flight crew training events for the relevant crews. Data collection should reach a minimum of 80% of all relevant flights and training conducted by the operator. This proportion may be varied at the discretion of the Authority.

2 The purpose of either an FDM or advanced FDM programme is to enable the operator to:

2.1 Provide data to support the programme's implementation and justify any changes to the ATQP;

2.2 Establish operational and training objectives based upon an analysis of the operational environment;

2.3 Monitor the effectiveness of flight crew training and qualification.

3 Data Gathering.

3.1 FDM programmes should include a system that captures flight data, and then transforms the data into an appropriate format for analysis. The programme should generate information to assist the operations safety personnel in analysing the data. The analysis should be made available to the ATQP postholder.

3.2 The data gathered should:

a. Include all fleets that plan to operate under the ATQP;

b. Include all crews trained and qualified under the ATQP;

c. Be established during the implementation phase of ATQP; and

d. Continue throughout the life of the ATQP.

4 Data Handling.

4.1 The operator should establish a process, which ensures the strict adherence to any data handling protocols, agreed with flight crew representative bodies, to ensure the confidentiality of individual flight crew members.

4.2 The data handling protocol should define the maximum period of time that detailed FDM or advanced FDM programme data, including exceedences, should be retained. Trend data may be retained permanently.

5 An operator that has an acceptable operations flight data monitoring programme prior to the proposed introduction of ATQP may, with the approval of the Authority, use relevant data from other fleets not part of the proposed ATQP.

**(l) Safety Case**

1.1 A documented body of evidence that provides a demonstrable and valid

*justification that the programme (ATQP) is adequately safe for the given type of operation. The safety case should encompass each phase of implementation of the programme and be applicable over the lifetime of the programme that is to be overseen.*

*1.2 The safety case should:*

- a. Demonstrate the required level of safety;*
- b. Ensure the required safety is maintained throughout the lifetime of the programme;*
- c. Minimise risk during all phases of the programmes implementation and operation.*

*2 Elements of a Safety Case:*

*2.1 Planning: Integrated and planned with the operation (ATQP) that is to be justified;*

*2.2 Criteria: Develop the applicable criteria - see paragraph 3 below;*

*2.3 Documentation: Safety related documentation – including a safety checklist;*

*2.4 Programme of implementation: To include controls and validity checks;*

*2.5 Oversight: Review and audits.*

*3 Criteria for the establishment of a Safety Case.*

*3.1 The Safety Case should:*

- a. Be able to demonstrate that the required or equivalent level of safety is maintained throughout all phases of the programme, including as required by paragraph (c) below;*
- b. Be valid to the application and the proposed operation (ATQP);*
- c. Be adequately safe and ensure the required regulatory safety standards or approved equivalent safety standards are achieved;*
- d. Be applicable over the entire lifetime of the programme;*
- e. Demonstrate Completeness and Credibility of the programme;*
- f. Be fully documented;*
- g. Ensure integrity of the operation and the maintenance of the operations and training infra-structure;*
- h. Ensure robustness to system change;*
- i. Address the impact of technological advance, obsolescence and change;*
- j. Address the impact of regulatory change.*

*4 In accordance with paragraph (c) the operator may develop an equivalent method other than that specified above.*

comment by: *Virgin Atlantic Airways***Relevant Text:**

AMC 1 OR.OPS.145.FC 2.3 line Checks

2.3.6 Line checks should be conducted by a pilot in command nominated by the operator. **The person conducting the line check, who is described in 4.5.2 below, should occupy an observer's seat where installed.** His CRM assessments should solely be based on observations made during the initial briefing, cabin briefing, cockpit briefing and those phases where he occupies the observer's seat.

**Comment:**

Whilst 2.3.6.1 addresses one aspect of long/ultra long haul, nothing addresses the inevitable issue that a long haul operator will have, where a disproportionately greater number of F/Os are required.

VAA contends that a Line Check could be carried out on a first officer by a suitably qualified Captain from the Commander's seat and previous experience has shown that a line Check can be properly conducted under these circumstances

This was an acceptable practice until Appendix 1 to JAR-OPS 1.965 was amended on the 01.08.2006. Additionally we were able to continue this practice beyond this date until the introduction of EU-OPS on the 16th July 2008.

**Proposal**

2.3.6 Line checks should be conducted by a pilot in command nominated by the operator. **The person conducting the line check, who is described in 4.5.2 below, should occupy an observer's seat whenever CRM aspects are to be observed.** His CRM assessments should solely be based on observations made during the initial briefing, cabin briefing, cockpit briefing and those phases where he occupies the observer's seat.

**European Regions Airline Association Comment**

ERA members have been in the forefront of applying pressure on EASA to develop without delay rulemaking action on aircraft ground de-icing / anti-icing operations. EASA consider this and other areas of this NPA provide provisions that may meet the concerns related to any lack of current individual rulemaking activity in this area. The ERA Directorate would disagree and stress that EASA as a matter of urgency should be looking at rulemaking action.

There is a need for explicit statements on the establishment of procedures and methods to be considered for incorporation.

comment by: *ECA - European Cockpit Association*

Comment on AMC3 OR.OPS.145.FC: Change all references to "system panel operators" to "flight engineer":

AMC3 OR.OPS.145.FC Recurrent training and checking

**~~SYSTEM PANEL OPERATORS~~ FLIGHT ENGINEERS**

1 The recurrent training and checking for ~~System Panel Operators~~ **flight engineers** should meet the requirements for pilots and any additional specific duties, omitting those items that do not apply to ~~System Panel Operators~~ **flight engineers**

2 Recurrent training and checking for ~~System Panel Operators~~ **flight engineers** should, whenever possible, take place concurrently with a pilot

undergoing recurrent training and checking.  
 3 A line check should be conducted by a pilot in command or by a **system panel operator flight engineer** nominated by the operator, in accordance with national rules, if applicable.

Justification:

Remove the term "system panel operator"  
 The station on the a/c is a flight engineer station  
 The pilot operating in this position will have been given flight engineer duty training  
 OR.OPS.025FC states flight engineer and flight engineer station

comment

3451

comment by: UK CAA

**Page No:** 93

**Paragraph No:**  
 AMC3 OR.OPS.145.FC

**Comment:**

The title and content of the reference refers to "System Panel Operators" but in OR.OPS.145.FC there is no reference to them only to flight crew. OR.OPS.025.FC refers to Flight Engineers and if the System Panel Operator in the AMC3 refers to Flight Engineers then it should say so. Flight Engineers are classified as flight crew.

**Justification:**

Consistency of flight crew classification throughout the document.

**Proposed Text (if applicable):**

Change the title and all references from "System Panel Operators " to "*Flight Engineers*". It is believed that there are no aircraft in the EU that have flight crew other than flight engineers and pilots.

comment by: UK CAA

**Page No:** 93**Paragraph No:** AMC2.OR.OPS.145.FC

**Comment:** Water survival training should include a mandatory requirement to undergo underwater escape training for those operators who predominately operate offshore.

**Justification:** There is clear evidence that upon ditching, a helicopter is highly likely to overturn and submerge the crew and cabin compartments with an escape being made through emergency exits. It is already a requirement for 3 yearly instruction and use of emergency exits but this stops short of a meaningful drill. Likewise, survivability for passengers is predicated upon the crew commencing survival drills, which can only happen if they have escaped the ditched aircraft.

**Proposed Text (if applicable):**

2. Where operations are predominately conducted offshore, operators are to conduct 3 yearly Helicopter Underwater Escape Training at an appropriate facility.

comment

1460

comment by: Pietro Barbagallo ENAC

**Comment:** 3.1 The phrase....All other training and checking..... should be changed as follows: All other training and checking should be performed in an FSTD, an approved flight simulator or, if the previous are not available, in an aircraft of the same type or in the case of emergency and safety equipment training, in a representative training device. All the rest unchanged.

**Justification:** As it is written the phrase has led to endless arguing with Operators that don't like simulators for various reasons and prefer proficiency checks on the aeroplane. This deprives their crews of the essential non normal and emergency drills that, for safety reasons, can't be simulated in flight. The comment is intended to add more emphasis on simulator checking.

**Comment:**

The paragraph refers to the use of FSTDs for training but only for helicopters. There are emergency practices in aeroplanes that must not be simulated in the aircraft because of the danger in which they would place the aircraft e.g. rejected take-off, explosive decompression etc. and if it is felt that helicopter training and testing needs a simulator for emergency exercises the same must be true for aeroplanes.

**Justification:** Consistency of safety training requirements in aircraft.

**Proposed Text (if applicable):** reword para 5.2 as follows:

*5.3 Aeroplanes & Helicopters*

*5.2.3 Where 'helicopter' is used replace with a generic term such as 'aircraft' or 'helicopter and aeroplane'*

comment by: UK CAA

**Page No:** 94

**Paragraph No:**

GM OR.OPS.145.FC para 5.2.2

**Comment:**

The content of this paragraph applies to any training and testing conducted as part of a proficiency check. It isn't only applicable to FSTD training and testing and therefore should be removed from this particular paragraph and placed in general training & testing at AMC1 OR.OPS.135.FC (page 85) as a new para 1.3

**Justification:**

It is applicable to all forms of training and testing

**Proposed Text (if applicable):** Delete existing paragraph 5.2.2 (then renumber) and re-insert same text as a new paragraph in AMC1 OR.OPS.135.FC para 1.3

Technical comment.

Page 95 AMC1 OR.OPS.155.FC §1.4.b.i: Operations on more than one type or

variant / Before exercising the privileges of 2 licence endorsement: this subparagraph of this AMC - coming from Appendix 1 to EU/JAR-OPS1.980 - says that "flight crew members [...] should have 500 hours in the relevant crew position in commercial air transport operations within the same operator". Our comment is to say that this high number of flight hours (500) within the same operator, and in CAT operations, is too much burdensome, especially in the business aviation world. If a flight crew wants to benefit from this requirement, the constraints "same operator" and "CAT" needs to be relaxed, at least for the business aviation world. Our proposal for this § is to remove "within the same operator" and "CAT" to read "*flight crew members should have completed two consecutive operator proficiency checks and should have completed 500 hours in the relevant crew position*"

### Relevant text

- 1 1.2 When a flight crew member operates more than one aeroplane type or variant within one or more license endorsements ...  
1.4 When a flight crew member operates more than one aeroplane type or variant...

### Comment:

Transferring appendix 1 of OPS 1.980 is adequate provided that provisions for allowance of credit described in this AMC are contained and authorized at implementing rule (law) level (see previous comments).

In addition, it is suggested to introduce adequate reference to Part 21 OSC, so as to allow the Aircraft manufacturers to demonstrate commonality and have operators taking credit from this work. This should not be misinterpreted as AEA support for the current O-SC concept and process (see AEA comments to

NPA 2009-1) but it should be seen as a desire from AEA/operators to get credit from existing JOEB processes.

**Proposal:**

***Proposal: Suggest to modify § 1.2 and § 1.4 as follows (see highlighted bold text):***

1.2 When a flight crew member operates more than one aeroplane type or variant within one or more licence endorsement as defined by Part FCL and associated procedures for type – multi pilot, an operator should ensure that:

- a. The minimum flight crew complement specified in the Operations Manual is the same for each type or variant to be operated;
- b. A flight crew member does not operate more than two aeroplane types or variants for which a separate licence endorsement is required, **unless otherwise specified in the Operational Suitability Certificate issued in accordance with Part 21.**

1.4 When a flight crew member operates more than one aeroplane type or variant and associated procedures for type-multi pilot, but not within a single licence endorsement, the operator should comply with the following:

- a. Subparagraph 1.2 above;
- b. Before exercising the privileges of **2 more than one** licence endorsement:
  - i. Flight crew members should have completed two consecutive operator proficiency checks and should have 500 hours in the relevant crew position in commercial air transport operations with the same operator.
  - ii. In the case of a pilot having experience with an operator and exercising the privileges of **2 more than one** licence endorsements, and then being promoted to command with the same operator on one of those types, the required minimum experience as pilot in command is 6 months and 300 hours, and the pilot should have completed 2 consecutive operator proficiency checks before again being eligible to exercise **2 more than one** licence endorsement.
- c. Before commencing training for and operation of another type or variant, flight crew members should have completed 3 months and 150 hours flying on the base aeroplane which should include at least one proficiency check, **unless otherwise specified in the Operational Suitability Certificate issued in accordance with Part 21.**
- d. After completion of the initial line check on the new type, 50 hours flying or 20 sectors should be achieved solely on aeroplanes of the new type rating, **unless otherwise specified in the Operational Suitability Certificate issued in accordance with Part 21.**
- e. Recent experience requirements established in Part FCL **and approved in accordance with Part 21, if applicable,** for each type operated, **unless otherwise specified in the Operational Suitability Certificate issued in accordance with Part 21.**
- f. The period within which line flying experience is required on each type should be specified in the Operations Manual.
- g. When credits are established and approved in accordance with Part 21 for the relevant type or variant, this should be reflected in the training required in OR.OPS.145.FC and:
  - i. OR.OPS.145(b) requires two operator proficiency checks every year. When credit is approved in accordance with Part 21 for operator proficiency checks to alternate between **the two** types, each operator proficiency check revalidates the operator proficiency check for the other types. The operator proficiency check may be combined with the proficiency checks for revalidation or renewal

of the aeroplane type rating or the instrument rating in accordance with Part FCL.

When credit for line check is approved in accordance with Part 21, line check may then be conducted as specified in the Operational Suitability Certificate issued in accordance with Part 21.

h. Annual emergency and safety equipment training and checking should cover all requirements for each type.

1733

comment by: REGA

**2.1. c)** To facilitate and to be able to plan more efficient the training and checking of crew members (Flight Crew and Technical Crew Member), the period of validity should be equal for all kind of checks. REGA decided to check the crew member every 12 months for their relevant duties. After several years of experience REGA does not see any advantage in shorter checking periods or any negative impact regarding to flight safety.

**Proposal (c)**

The period of validity for Operator Proficiency Check, Line Check, Emergency and Safety Checks and the according training shall be 12 months.

2.1. e) Technology, operational procedures, handling characteristics of non-complex helicopters are quite similar. A limitation of only 3 types of non-complex helicopters is not proportional to flight safety targets. As long as training recency is provided operations with different types of non-complex helicopters shall be accepted by the competent Authority.

3.1 To limit the amount of types without neither consider their complexity nor certified take-off mass (MCTOM) or the maximum passenger seating configuration seems not adequate.

**Proposal (3)**

*For a combination of helicopter and aeroplane.*

*3.1 a) flight crew member may fly two complex helicopters and two non-complex aeroplanes or one complex aeroplane;*

*3.1 b) flight crew member may fly two complex aeroplane and two non-complex helicopters or one complex helicopter.*

comment by: Airbus

**AMC1 OR.OPS.155.FC Operation on more than one type or variant**

1.2 When a flight crew member operates more than one aeroplane type or variant within one or more licence endorsement as defined by PartFCL and associated procedures for type – multi pilot, an operator should ensure that:

a. The minimum flight crew complement specified in the Operations Manual is

the same for each type or variant to be operated;

b. A flight crew member does not operate more than two aeroplane types or variants for which a separate licence endorsement is required;

**Comment 1 :** the highlighted limitation is now in an AMC. Historically it was a safeguard to avoid a flight crew operate aeroplanes under different license endorsement for which there was no real commonality concept. With the technology advances within cockpit and flight characteristics (fly by wire) this limitation may not be necessarily justified if aircraft manufacturers under the Operational Suitability process are able to demonstrate that this could be achieved. It is the reason why Airbus recommend to keep the limitation in the AMC for combination of aircraft for which no demonstration has been made, but Airbus would like to recommend taking benefit of the newly suggested Operational Suitability Certificate to provide an alternate way.

Under the OSC, a manufacturer may elect to demonstrate commonality and recommendations for operations of more than one type or variant, and results of this demonstration should then be available for use by the operators if they would wish.

**Proposal 1:** amend AMC1 OR.OPS.155.FC § 1.2 b to read:

"A flight crew member does not operate more than two aeroplane types or variants for which a separate licence endorsement is required, unless otherwise specified in the Operational Suitability Certificate issued in accordance with Part 21."

**Comment 2 :** as a consequence of adjustment of § 1.2 b, the reference to 2 licence endorsements need to be adjusted in paragraph 1.4.

In line with this potential capability of the aircraft manufacturer to demonstrate commonality credit recognised/approved in the proposed Operational Suitability Certificate, the consolidation period of § 1.4.d suggesting 50 hours flying or 20 sectors, could be potentially reduced if aircraft are demonstrated to be very similar: same approach would apply for the recent experience requirements, recurrent training and checking as well as line check.

**Proposal 2:** amend AMC1 OR.OPS.155.FC § 1.4 (suggested changes are identified by strikethrough and highlight):

1.4 When a flight crew member operates more than one aeroplane type or variant and associated procedures for type-multi pilot, but not within a single licence endorsement, the operator should comply with the following:

a. Subparagraph 1.2 above;

b. Before exercising the privileges of **2 more than one** licence endorsement:

i. Flight crew members should have completed two consecutive operator proficiency checks and should have 500 hours in the relevant crew position in commercial air transport operations with the same operator.

ii. In the case of a pilot having experience with an operator and exercising the privileges of **2 more than one** licence endorsements, and then being promoted to command with the same operator on one of those types, the required minimum experience as pilot in command is 6 months and 300 hours, and the pilot should have completed 2 consecutive operator proficiency checks before again being eligible to exercise **2 more than one** licence endorsement.

c. Before commencing training for and operation of another type or variant, flight crew members should have completed 3 months and 150 hours flying on the base aeroplane which should include at least one proficiency check, **unless otherwise specified in the Operational Suitability Certificate issued in**

**accordance with Part 21.**

d. After completion of the initial line check on the new type, 50 hours flying or 20 sectors should be achieved solely on aeroplanes of the new type rating, **unless otherwise specified in the Operational Suitability Certificate issued in accordance with Part 21.**

e. Recent experience requirements established in Part FCL ~~and approved in accordance with Part 21, if applicable,~~ for each type operated, **unless otherwise specified in the Operational Suitability Certificate issued in accordance with Part 21.**

f. The period within which line flying experience is required on each type should be specified in the Operations Manual.

g. When credits are established and approved in accordance with Part 21 for the relevant type or variant, this should be reflected in the training required in OR.OPS.145.FC and:

i. OR.OPS.145(b) requires two operator proficiency checks every year. When credit is approved in accordance with Part 21 for operator proficiency checks to alternate between ~~the two~~ types, each operator proficiency check revalidates the operator proficiency check for the other types. The operator proficiency check may be combined with the proficiency checks for revalidation or renewal of the aeroplane type rating or the instrument rating in accordance with Part FCL.

ii. ~~OR.OPS.145 (c) requires one line check every year, When credit is approved in accordance for Part 21 for line checks to alternate between types or variants, each line check revalidates the line check for the other types or variant.~~ **When credit for line check is approved in accordance with Part 21, line check may then be conducted as specified in the Operational Suitability Certificate issued in accordance with Part 21.**

h. Annual emergency and safety equipment training and checking should cover all requirements for each type.

**Comment:**

Transferring appendix 1 of OPS 1.980 is adequate provided that provisions for allowance of credit described in this AMC are contained and authorized at implementing rule (law) level (see previous comments).

In addition, it is suggested to introduce adequate reference to Part 21 OSC, so as to allow the Aircraft manufacturers to demonstrate commonality and have operators taking credit from this work. This should not be misinterpreted as AEA support for the current O-SC concept and process (see AEA comments to NPA 2009-1) but it should be seen as a desire from AEA/operators to get credit from existing JOEB processes.

**Proposal:**

***Proposal: Suggest to modify § 1.2 and § 1.4 as follows (see highlighted bold text):***

1.2 When a flight crew member operates more than one aeroplane type or variant within one or more licence endorsement as defined by Part FCL and associated procedures for type – multi pilot, an operator should ensure that:

a. The minimum flight crew complement specified in the Operations Manual is the same for each type or variant to be operated;

b. A flight crew member does not operate more than two aeroplane types or variants for which a separate licence endorsement is required, **unless otherwise specified in the Operational Suitability Certificate issued in accordance with Part 21.**

1.4 When a flight crew member operates more than one aeroplane type or

variant and associated procedures for type-multi pilot, but not within a single licence endorsement, the operator should comply with the following:

- a. Subparagraph 1.2 above;
- b. Before exercising the privileges of **2 more than one** licence endorsement:
  - i. Flight crew members should have completed two consecutive operator proficiency checks and should have 500 hours in the relevant crew position in commercial air transport operations with the same operator.
  - ii. In the case of a pilot having experience with an operator and exercising the privileges of **2 more than one** licence endorsements, and then being promoted to command with the same operator on one of those types, the required minimum experience as pilot in command is 6 months and 300 hours, and the pilot should have completed 2 consecutive operator proficiency checks before again being eligible to exercise **2 more than one** licence endorsement.
- c. Before commencing training for and operation of another type or variant, flight crew members should have completed 3 months and 150 hours flying on the base aeroplane which should include at least one proficiency check, **unless otherwise specified in the Operational Suitability Certificate issued in accordance with Part 21.**
- d. After completion of the initial line check on the new type, 50 hours flying or 20 sectors should be achieved solely on aeroplanes of the new type rating, **unless otherwise specified in the Operational Suitability Certificate issued in accordance with Part 21.**
- e. Recent experience requirements established in Part FCL ~~and approved in accordance with Part 21, if applicable,~~ for each type operated, **unless otherwise specified in the Operational Suitability Certificate issued in accordance with Part 21.**
- f. The period within which line flying experience is required on each type should be specified in the Operations Manual.
- g. When credits are established and approved in accordance with Part 21 for the relevant type or variant, this should be reflected in the training required in OR.OPS.145.FC and:
  - i. OR.OPS.145(b) requires two operator proficiency checks every year. When credit is approved in accordance with Part 21 for operator proficiency checks to alternate between ~~the two~~ types, each operator proficiency check revalidates the operator proficiency check for the other types. The operator proficiency check may be combined with the proficiency checks for revalidation or renewal of the aeroplane type rating or the instrument rating in accordance with Part FCL.

**When credit for line check is approved in accordance with Part 21, line check may then be conducted as specified in the Operational Suitability Certificate issued in accordance with Part 21.**

- h. Annual emergency and safety equipment training and checking should cover all requirements for each type.

**Page No:** 95

**Paragraph No:**  
AMC1 OR.OPS.155.FC 1.4 i. ii. and h.

**Comment:**

Existing paragraphs have been changed from those in EU-OPS. Current paragraph h. should be titled iii. As per Appendix 1 to OPS 1.980. Paragraph 8 in Appendix 1 to OPS 1.980 has been excluded.

**Justification:**

Editorial and omission from the existing OPS text resulting in different definition.

**Proposed Text (if applicable):** Change paragraph h. to be iii. Add para h) as per paragraph 8 in Appendix 1 to OPS 1.980. Indent para i, ii, iii.

comment 3456

comment by: UK CAA

**Paragraph No:**

AMC1 OR.OPS.155.FC para 2.1 (a) and (b)

**Comment:**

Although these two subparagraphs are a direct copy from JAR-OPS AMC OPS 3.980 para 2 (c) & (d), they create a safety anomaly (as they currently do for those operators who fly in accordance with JAR-OPS 3). A pilot who flies a Robinson R22 (two seater piston VFR only helicopter) and who also flies an EH101 (a 25 seat multi-engine (3 turbine engines), multi-pilot IFR helicopter) may apply the content of the reference to permit him to complete one operator proficiency check (OPC) every 6 months and this would validate the OPC for the other type. This would meet the rule but at the same time be illogical.

The introduction of EASA Part OPS is the opportunity to remedy this anomaly.

A simple addition to the AMC could solve this problem by restricting the alleviation to types and variants within a particular group. A suggested group is attached to this comment below for use and inclusion in the AMC if considered necessary.

**Justification:**

Removal of a safety anomaly.

**Proposed Text (if applicable):** Insert the following text in para 2.1 (c);  
 "...met by a 6 monthly check on any one type or variant operated *from within a particular group from the table below.*"

Insert the table below paragraph 2.1 (c)

Group	Types included
1 All Pistons	R22, R44, H269, Bell 47, Enstrom, Brantley, Hiller
2 Single Engine Turbines	All types
3 MET < 3175 kgs MTOW SPH	All types
4 MET >3175 kgs & <5700 kgs SPH group	S76, EC155, SA365, Bell 212/412 etc

5	MET >5700 kgs MPH Group	Individual types

AMC2 OR.OPS.155.FC Operation on more than one type or variant  
METHODOLOGY - USE OF OPERATOR DIFFERENCE REQUIREMENT (ODR)  
TABLES - AEROPLANES

**Question/comment :** As former Appendix to EU OPS 1.980 is now in AMC, why should this material (formerly in TGL 44) remain an AMC? Should it not be considered as a Guidance Material, and regrouped together with GM OR.OPS.155.FC? In fact, to be able to apply the methodology, one needs first to understand the terminology, the definitions of levels and the philosophy.

It should also be clarified that the objective of the methodology is to allow operation of more than one type or variant for which a separate licence endorsement is required (not within a single licence endorsement)

**Proposal:** Combine this AMC and GM OR.OPS.155.FC into one single GM, with amendment of § 2.1 to read:

2.1 Before requiring flight crew members to operate more than one type or variant, operators should first nominate one aeroplane as the Base Aeroplane from which to show differences with the second aeroplane type or variant, the 'difference aeroplane', in terms of technology (systems), procedures, pilot handling and aeroplane management. **Proposal:**

Modify § 2.1 as follows:

*2.1 Before requiring flight crew members to operate more than one type or variant, operators should first nominate one aeroplane as the Base Aeroplane from which to show differences with the second aeroplane type or variant, the 'difference aeroplane', in terms of technology (systems), procedures, pilot handling and aeroplane management. These differences, known as Operator Difference Requirements (ODR), preferably presented in tabular format, constitute part of the justification for operating more than one type or variant, specially when **not within a single licence endorsement**, and also the basis for the associated differences/familiarisation training for the flight crew.*

2 ODR Tables

2.1 Before requiring flight crew members to operate more than one type or variant, operators should first nominate one aeroplane as the Base Aeroplane from which to show differences with the second aeroplane type or variant, the 'differenceNPA 2009-02c 30 Jan 2009 Page 97 of 136 aeroplane', in terms of technology (systems), procedures, pilot handling and aeroplane management. These differences, known as Operator Difference Requirements (ODR), preferably presented in tabular format, constitute part of the justification for operating more than one type or variant and also the basis for the associated differences/familiarisation training for the flight crew

**Comment:**

As appendix 1 of OPS 1.980 was transferred to AMC 1.OR.OPS.155.FC, should this AMC 2 be transferred into GM into the EU rule structure, as it provides a methodology.

It should also be clarified that the methodology objective is to allow operation of more than one type or variant for which a separate licence endorsement is required (not within a single licence endorsement)

**Proposal:**

Modify § 2.1 as follows:

*2.1 Before requiring flight crew members to operate more than one type or variant, operators should first nominate one aeroplane as the Base Aeroplane from which to show differences with the second aeroplane type or variant, the 'difference aeroplane', in terms of technology (systems), procedures, pilot handling and aeroplane management. These differences, known as Operator Difference Requirements (ODR), preferably presented in tabular format, constitute part of the*

*justification for operating more than one type or variant ,specially when **not within a single licence endorsement**, and also the basis for the associated differences/familiarisation training for the flight crew.*

AMC2 OR.OPS.155.FC Operation on more than one type or variant  
 METHODOLOGY - USE OF OPERATOR DIFFERENCE REQUIREMENT (ODR)  
 TABLES - AEROPLANES

**Question/comment :** As former Appendix to EU OPS 1.980 is now in AMC, why should this material (formerly in TGL 44) remain an AMC? Should it not be considered as a Guidance Material, and regrouped together with GM OR.OPS.155.FC? In fact, to be able to apply the methodology, one needs first to understand the terminology, the definitions of levels and the philosophy.

It should also be clarified that the objective of the methodology is to allow operation of more than one type or variant for which a separate licence endorsement is required (not within a single licence endorsement)

**Proposal:** Combine this AMC and GM OR.OPS.155.FC into one single GM, with amendment of § 2.1 to read:

2.1 Before requiring flight crew members to operate more than one type or variant, operators should first nominate one aeroplane as the Base Aeroplane from which to show differences with the second aeroplane type or variant, the 'difference aeroplane', in terms of technology (systems), procedures, pilot handling and aeroplane management. These differences, known as Operator Difference Requirements (ODR), preferably presented in tabular format, constitute part of the justification for operating more than one type or variant, **specially when not within a single licence endorsement**, and also the basis for the associated differences/familiarisation training for the flight crew.

comment 850

comment by: ECA - European Cockpit Association

Comment on GM OR.OPS.110.CC: Upgrade to OR.OPS.110.CC and change as follows:

SELFEMPLOYED, FREELANCE OR PARTTIME CABIN CREW

Before assigning to duties a cabin crew member who is selfemployed and/or working on a freelance or parttime basis, the operator ~~should~~ **shall** give particular attention to all applicable requirements of this Section with special regard to the number of aircraft types and variants operated and to flight and duty time limitations and rest requirements.

Justification:

This should be IR material; the operator has to take into account what a cabin crew member is doing with other operators. Otherwise all requirements in this section are invalidated.

comment 947

comment by: AEA

**Relevant Text:** title of the paragraph

GM OR.OPS.110.CC Conditions for assignment of cabin crew to duties

**Comment:** 'assignment to duties' should be limited to 'assignment to **safety** duties' taking into account the fact that EASA should only regulate safety but not other elements related to cabin crew.

**Proposal:** change title to

### **OR.OPS.120.CC Conditions for assignment to duties**

#### **(a)**

**Comment:**

This pre-supposes that a Cabin Crew Attestation of Part CC[Cabin Crew Licence] replaces **EU-OPS 1.1035 2.** " keep a copy of the attestation of safety training."

The requirement as laid down under Subpart CCA **CC.CCA.100 Cabin crew attestation** is vigorously rejected as an over bureaucratic requirement which does not serve to add any greater element of safety to that provided by the current EU-OPS 1.1035 noted above.

**Proposal:**

**Delete:** The requirement for a CC Attestation as under **CC.CCA.100 Cabin crew attestation** in it's entirety.

#### **(b) The operator shall also ensure that:**

(1) all and only the cabin crew members assigned to duties on a flight wear the operator's cabin crew uniform;

**Comment** – Does this preclude crew from positioning as passenger on our or other aircraft in uniform? Clarification is required.

**Proposal:**

The wording contained within OPS 1.989 is adopted.

Identification

(a) An operator shall ensure that all cabin crew members wear the operator's cabin crew uniform and are clearly identifiable to the passengers as a cabin crew member.

- comment 1840 comment by: Jill Pelan
- New: **AMC OR.OPS.CC 100**  
**(b) For identification the CC should wear the operator's uniform.**

1971

comment by: *Walter Gessky*

**1. AMC1 OR.OPS.115.CC Training courses and associated checking**  
INITIAL TRAINING COURSE

Add the following:

1. For noncommercial operations, cabin crew members holding a valid cabin crew attestation in accordance with PartCC and proficient on the aircraft type to be operated need not be provided by the operator with all the training required in PartCC **but s hould co mplete a t le ast a ty pe t raining and familiarization** and be trained in accordance with the applicable requirements of PartOR.

**Justification:**

In addition to the initial safety training attested by the attestation only, at least a type training and familiarization training is required.

Add a new **3.**

**When in addition to the initial safety training, conversion, differences**

**and familiarization training is provided by an independent training organization this training organization has to show that all operator specific data are available (aircraft or simulator in line with the configuration of the operator where the cabin crew member is intended to be assigned for duties).**

**Justification:**

For conversion and differences training it is important that the training organization has all operator related data available, like OM including cabin emergency procedures etc. and has a cabin mockup available in the aircraft configuration.

comment 2860 comment by: *Civil Aviation Authority of Norway*

Comment to 1.3 a;  
A cabin crew CRM instructor should not be required to have previous experience as an operating cabin crew member, as this would disqualify the use of CRM instructors with other relevant aviation experience.

Comment ref page 104 para 2.1

This requirement to have cabin and flight crew CRM instructors observe each other and comment on each other's style is completely impractical and must be removed. In large organisations where CRM training takes place in many diverse locations it is simply not possible to arrange this without significant cost and inefficiencies. Large organisations have hundreds of CRM instructors.

It is the task of training managers to oversee the activities of instructors and to unify their style and method. Once provision for **THIS** is in place the function is catered for.

Proposal

2.1 There should be an effective liasion between flight crew and cabin/technical crew training departments. Provision should be made for training managers to observe and comment on CRM instrutors training. Consideration.....

As most UK operators refer to Conversion training as stated in EU-OPS it should also be mentioned here.

Drop down oxygen has been removed from this list but due to the difference in

number of masks and duration of oxygen across different aircraft it is felt this should be reinstated.

**Summary of EASA Proposed Requirement:**

Requirement detailed that New Entrant Crew are required to complete familiarisation flights

**Comment:**

There is no reference to the number of sectors required for a familiarisation flight.

**Justification:**

The number of sectors required by non commercial operators is detailed in the rules as 2 however no similar requirement detailed for commercial operators. Can clarification be given, particularly for longhaul operators.

(2) New entrant cabin crew

Each new entrant cabin crew member having no previous comparable operating experience should;

- a) Participate in a visit as described in paragraph 4 to the aircraft to be operated and
- b) Participate in familiarisation flights as described in paragraph 3.

**Comments:**

No reference to the number of sectors required to complete familiarisation.

**Proposed Text:**

New entrant cabin crew should be assigned to operate at least 2 flight sectors under supervision.

Comment

The need to have a specific period and aircraft given over to providing an "overview" of the aircraft environment during an "Aircraft Visit" should be altered to allow the requirement to be fulfilled over the period of the Familiarisation flights.

Previous theoretical and practical training given by a Safety Instructor on a Representative Training Device means that the requirement for the Visit is only an "Overview" of specified items. Thus, the "Suitably Qualified Person" should include Senior Cabin Crew Members (SCCM) whose qualification, knowledge and expertise is acknowledged in section 3.2 where the conduct of the Familiarisation flights is entrusted to the SCCM.

Our proposal, if accepted will: -

Maintain current safety levels: -

- The student will be extra to the normal operational crew while the

familiarisation training takes place.

Enhance Training by: -

- Allowing the training to take place in a One-to-One environment instead of in a group environment often involving classes of significant size.
- Allowing the training to take place over the period of the familiarisation flights rather than in an aircraft that could be undergoing maintenance or could be required for line operations thus rushing the training.
- Audio-visual training aids, including videos, can be used to prepare the student for the "overview" training so that the actual familiarisation with the relevant items is, in fact, consolidation of previously instructed material.

Provide an operator with significant efficiencies:-

- Not required to assign an aircraft to this element of training
- not required to assign a Safety instructor to the function
- Able to use an already rostered SCCM to conduct the overview training

Proposal.

comment by: *Vairis VELDE*

Different terms such as **sectors** (OR.OPS.255.CC Single cabin crew operations), **flight sectors**, **flight/flights** are used for description of cabin crew familiarization flying requirements.

The suggestion would be to use **sector/sectors** everywhere, as it is written in flight crew requirements.

comment

3218

comment by: *Vairis VELDE*

The suggestion would be to consider the resignation from odd sector familiarisation flying for cabin crews, since most of the trips consist of an

outbound and inbound sector. Out of the home base there will be flying an augmented cabin crew since during familiarisation flights, the cabin crew member should be additional to the minimum number of cabin crew required, and most likely on an inbound flight there will be also the same augmented cabin crew. In this way augmented crew would be used expediently for additional flight where cabin crew would be supervised by the senior cabin crew member.

comment 3229

comment by: *Vairis VELDE*

No familiarisation requirements for cabin crews who will operate currently operated aircraft type or variant with different operator with different safety equipment, safety equipment location or normal and emergency safety procedures.

Summary of EASA Proposed Requirement:  
Training Programme

Comment:  
Does not clearly define what is 1 yearly or 3 yearly requirements.

Justification:  
Requires clearer definition to ensure that this reflects the rule requirement.

Proposed Text (if applicable)  
Before 1.4 insert: **At inter vals not exceeding thr ee years recurrent training also includes 1.4 Training on operation of normal .....**

comment

2455

comment by: *Virgin Atlantic Airways***Relevant Text:**

Operators recurrent training and associated checking.  
1 Training programme

**Comments**

1 yearly and 3 yearly requirements are not clearly defined. AMC is actually more detailed than the rule.

**Proposed Text:**

An operator shall ensure that every 12 calendar months the training includes the following;

The location and handling of emergency equipment including oxygen systems, and the donning by each crewmember of lifejackets, portable oxygen and protective breathing equipment.

Training on emergency situations including pilot incapacitation procedures and crowd control techniques. Etc

An operator shall ensure that, at intervals not exceeding 3 years recurrent training also includes;

1) Each cabin crew member operating and actually opening each type or variant of normal and emergency exit in the normal and emergency modes, including failure of power assist systems where fitted. This is also to include the action and forces required to operate and deploy evacuation slides. This training shall be conducted in an aircraft or representative device.

2) The demonstration of the operation of all other exits including flight deck windows.

3) The realistic and practical training in the use of all fire fighting equipment including protective clothing representative of that carried in the aircraft. Etc.

comment 3174 comment by: Irish Aviation Authority

Comment:  
 Insert as paragraph 1.6 - Pilot Incapacitation is listed in OR OPS .135.CC, paragraph (c) as required within intervals not exceeding 3 years, "(c) (1) each cabin crewmember (ii) undergoing pilot incapacitation training if applicable"  
 However, the AMC to OR OPS 1.35 CC does not expand on what is required.

Justification:  
 In order to retaining familiarity with the practical skills acquired in the type conversion training

Proposed text:  
 (insert same text as per AMC.OR.OPS.125.CC paragraph 7)  
 "Unless the cabin crew is more than 2, each cabin crewmember should be trained in the procedures for flight crew incapacitation and should operate the seat and harness mechanisms....etc..."

Comment reference GM OR.OPS.140.CC

This section is extremely vague. The use of the word "consider" implies that it is not mandatory. The timeframe described is strange - "less than 6 months". A day is less than six months so is 5.5 months.

This section will accomplish nothing as written. It can only lead to difficulties for an operator if, having considered the need for refresher training and rejected it, a CCM is involved in an incident and complications arise.

**Proposal**

As I cannot be sure what the intention of the section is I cannot really propose alternate text.

As written, it should be withdrawn for the above stated reasons.

comment by: FSC - CCOO

1.2 all portable safety equipment ~~requires the same method of operation~~;

Replace with:

should be of the same make.

Reason: The proposed text is not precise enough i.e. which PBE's require the same method of operation?

comment 3132

comment by: ERA

**European Regions Airline Association Comment**

The portable safety equipments that absolutely need to be in the same or substantially the same location shall be limited to those requiring immediate use in case of emergency. We request to remove from this list: first aid oxygen equipment; megaphones; first aid equipment; survival equipment and signalling equipment; none of these pieces of equipment require immediate and instinctive use. As a matter of fact, these pieces of equipment prove usually impossible to locate exactly at the same position from one variant to another, and the "exceptional circumstances" is always used for them.

ERA therefore request to change the text as follows:

1.3 for the purpose of 1.1, portable safety equipment requiring immediate action includes:

e. torches; and

f. ~~megaphones;~~

g. ~~first-aid equipment;~~

~~h. survival equipment and signalling equipment; and~~  
~~i f. other safety equipment where applicable.~~

comment by: ANE (Air Nostrum) OPS QM

The portable safety equipments that absolutely need to be in the same or substantially the same location shall be limited to those requiring immediate use in case of emergency. We request to remove from this list: first aid oxygen equipment; megaphones; first aid equipment; survival equipment and signalling equipment; none of these pieces of equipment require immediate and instinctive use. As a matter of fact, these pieces of equipment prove usually impossible to locate exactly at the same position from one variant to another, and the "exceptional circumstances" is always used for them.

We therefore request to change the text as follows:

1. When determining similarity of location and type of portable safety equipment the following factors should be assessed to justify the finding of similarity:

1.1 all portable safety equipment **requiring immediate use** is stowed in the same, or in exceptional circumstances, in substantially the same location;

1.2 all portable safety equipment requires the same method of operation;

**1.3 for the purpose of 1.1, portable safety equipment requiring immediate action includes:**

a. fire fighting equipment

b. protective breathing equipment (PBE);

c. subsistence oxygen equipment  
 d. crew lifejackets;  
 e. torches, **and**;  
 f. megaphones  
 g. first aid equipment  
 h. survival equipment and signalling equipment, and  
 i. other safety equipment where applicable

comment

comment by: CUD

1.1 all portable safety equipment is stowed in the same, ~~or in exceptional circumstances, in substantially the same location;~~

Reason: Terms such as *exceptional circumstances* or *substantially the same* do not provide legal certainty.

comment

4030

comment by: CUD

1.2 all portable safety equipment ~~requires the same method of operation;~~

Replace with:

should be of the same make.

Reason: The proposed text is not precise enough i.e. which PBE's require the same method of operation?

Ref No.  
NPA 2009 - 2c AMC OR OPS 250 CC

Summary of EASA Proposed Requirement:  
Includes a list of portable safety equipment.

Comment:  
Currently the requirement states location and type of equipment.

Justification:  
The expanded list of equipment appears more restrictive.

**Page No:** 113 to 114

**Paragraph No:** AMC OR.OPS.015.TC Paras 1-4. Conditions for assignment of technical crew to duties

**Comment:** "Best aeromedical practice" (para 2) means applying appropriate standards to minimise risk to flight safety. Incapacitation of these technical members will have no impact on flight safety. These paragraphs **must** be deleted. Unnecessary regulatory burden. Task orientated occupational assessment **is** appropriate but technical crew members should not be subject to safety regulation medical requirements.

**Justification:** Paragraph OR.OPS.01.TC 33 defines technical crew as passengers. This complies with Para 33 on page 49 of Explanatory Note 2009-2A stating that these specialists are to be considered as passengers. It is inappropriate for medical standards to be set for passengers.

**Proposed Text (if applicable):**

Delete paragraphs 1 to 4 inclusive.

normal annual check shall be authorised in compliance with normal medical checks.

comment

3809

comment by: *Swedish Transport Agency, Civil Aviation Department (Transportstyrelsen, Luftfartsavdelningen)*

**Paragraph text:**

## GENERAL

1 A technical crew member in HEMS, HHO and NVIS operations should undergo an initial medical examination and assessment and, if applicable, a reassessment before undertaking duties.

2 Any medical assessment or reassessment should be carried out by a general medical practitioner who has sufficient detailed knowledge of best aeromedical practice and the applicant's medical background.

3 An operator should maintain a record of medical fitness for each technical crew member.

4 Technical crew members should:

a. be in good health;

b. be free from any physical or mental illness which might lead to incapacitation or inability to perform crew duties;

c. have normal cardiorespiratory function;

d. have normal central nervous system;

e. have adequate visual acuity 6/9 with or without glasses;

f. have adequate hearing; and

g. have normal function of ear, nose and throat.

**Comment:**

In 1. the expression 'If applicable' is copied from JAR ACJ OPS 3.995 (a)(2), but should be changed to 'When applicable' here. OR.OPS.015.TC has already added a requirement for TC also to be periodically assessed.

In 2. the requirement of 'Sufficient detailed knowledge of best aeromedical practice' is appreciated, but it should be noted that this requirement was not proposed for GMPs examining LPL holders. There should be a consistency, hence the same requirement should be introduced for GMPs examining LPL holders .

**Page No:** 115-116

**Paragraph No:**

AMC2 OR.OPS.20.TC 1 g / AMC OR.OPS.035.TC 2 g.

**Comment:**

It is not clear what the intention of this text is.

**Justification:**

A requirement for initial training in the "use of dangerous goods" is covered in AMC2 OR.OPS.20.TC 1 g (type related training) but the requirement for recurrent training (AMC OR.OPS.035.TC 2 g) applies to both general and type related training. But in any event it is difficult to conceive when training in the use of dangerous goods would be appropriate since other obvious dangerous goods i.e. Life rafts, Lifejackets, Fire extinguishers, Pyrotechnics and Emergency medical equipment are already addressed. It is also queried what/when dangerous goods would be type specific.

**Proposed Text (if applicable):**

Delete AMC2 OR.OPS.20.TC 1 g and AMC OR.OPS.035.TC 2 g.

comment by: *TUIfly Nordic*

The training including "use of pilots checklist" (item (d.)(iv.)) will not assist the pilot flying in a pilot incap. situation. Several Operators has testified that cabin crew members trying to read a pilot check list increase the workload for the pilot flying instead of reducing workload. This item should therefore be withdrawn.

comment by: *AIR SAFETY GROUP*

1. **AMC OR.OPS.015.FTL (b) - Nomination of Home Base. It is accepted that each crew member shall be nominated a single Home Base from where they normally report for duty and at which they, as individuals, are responsible for their own home accommodation. It is also accepted that on rare occasions a crew member may have to be re-allocated and posted to another base, which then becomes their new Home Base. However, having to move Home Base and relocate on average every 3 months (max. of 4 times per calendar year) is totally unacceptable and will involve much expense. Moving Home is judged to be one of the most stressful of life's events coming a close second to the death of one's spouse/partner. Strongly recommend that a crew member's 'Home Base must not be changed more than once in any 12 calendar months'. Also suggest adding '...and where the crew member is required to relocate, the operator will re-imburse the crew member for the full cost of such re-location'.**
2. **'Designated Reporting Point' is a phrase used elsewhere within the FTL Scheme and there is no specific definition. Is it intended that the Designated Reporting Point refers solely to the Home Base? If so this should be made clear. If not, then it means that on a day to day basis a crew member's normal Home Base can effectively be changed to include any number of Designated Reporting Points that may be many miles away or even in a different country to the normal nominated Home Base. How does the crew member reach the new designated reporting point and does the operator have to**

transport them there and is the time spent counted as duty, or FDP if followed by a flight? All such questions require specific answers or the whole system will be open to mis-interpretation and possible abuse.

3. **AMC OR.OPS.015.FTL(I) - What is a 'scheduled seasonal period'? Needs to be defined such that it is clear to all crew members the time period that it covers. (1) Suggest that if the planned schedule exceeds the normal maximum FDP on every third flight, then the 'planning' is seriously flawed and should never have been introduced! Suggest that Commander's Discretion is a fall back that should only be called upon on rare occasions, if the planning is realistic. Recommend change 33%, 15% and 10% to 5% in (1), (2) and (3).**
4. **General Comments - Fatigue Risk Management Systems - This is a relatively new and untried concept in commercial aviation. It will take a large degree of commitment and training by all company personnel including those responsible for the commercial aspirations of each company. Commercial pressure will be difficult to counter in order to ensure the risk of fatigue in crew members is avoided at all times. With each operator being able to devise their own specific FTL scheme and seek approval for its use, the possibility for excessive duty and flying hours being forced upon crew members is real if the management and scheduling staff within a company only pay lip service to its implementation and are not fully trained and committed to the concept. Additionally, all Regulatory Authority staff will require comprehensive training in FRMS in order to fully understand and oversee those operators new to the whole concept.**

comment by: *Air Atlanta/Haukur Eyjólfsson*

On behalf of Air Atlanta Icelandic:

Suggestion to remove the text: If operational necessities require the change of home base, it should not be changed more than 4 times in any given period of 12 months.

Justification and implementation problematic for Air Atlanta Icelandic:

Short:

The suggested maximum 4 base changes in any 12 consecutive month, is impossible to implement due to the type and nature of Air Atlanta's core operations and FIA Collective Work Agreement (CWA), with the pilot union. The justification of more frequent crew base changes is to ensure that crew member's rest is increased each time, when returning to their assigned crew base.

Details:

Air Atlanta's core business is ACMI lease to other Airlines globally. The company's headquarters are in Iceland, currently however there are no contracts for customers out of Iceland. Our current Crew Bases are KUL, BRU,

AMS, JED, RUH, AUH operating for MasKargo, Saudi Arabian Airlines and Etihad.

Contracts with Air Atlanta's customers are normally short-term, which are in some cases extended to a longer term agreements.

Air Atlanta has an employer employee relationship with crew members contracted by the FÍA (Icelandic Pilot Union) collective work agreement. These crew members encompass the majority of pilots currently operating our fleet. With a few exceptions all FÍA crew members have their domicile in Iceland, while Air Atlanta's bases are global. According to the CWA crew members rotate from being passive (on leave) at their place of domicile to being active crew members on Air Atlanta outstations with an interval 21\21 or 17\17 on the Airbus.

Each rotation is associated with two crew base changes for example when a crew member leaves to an outstation (example AUH) the crew member will be assigned the crew base KEF while on leave and crew base AUH upon arrival in AUH. As per definition of home base "... from where the crew member normally starts and ends a duty period or a series of duty periods.." their crew home base cannot be Keflavik (KEF), even though this is their permanent place of residence.

From a safety point of view the rest at home base is always increased both in terms of minimum rest and time zone crossing when returning to base in the current scheme. The crew member's WOCL is still in KEF for the first 48 hours after leaving KEF, reducing the allowable FDP and increasing the rest upon arrival to AUH (Due to time zone crossing).

The CWA requires that base assignments are fairly distributed between crew members in these rotations e.g. not always the same crew members are to AUH.

We agree with the provision, but we believe that the provision should be of a more legally binding character, and therefore should be transferred to the Implementing Rules (ex. to OR.OPS.015.FTL ).

comment

1191

comment by: *ECA - European Cockpit Association*

Comment on AMC OR.OPS.015.FTL(b):change as follows

The home base nominated by the Operator should not be changed for the purpose of extending the FDP or reducing the rest period. If operational necessities require the change of home base, it should not be changed more than **4 2** times in any given period of 12 calendar months **and only with the crew member's explicit assent.**

Justification:

The EASA proposed provision would mean that days free of duty could be given away from the crew member's social home base. This contradicts CD 2000/79 and CD 2003/88 and must be avoided! The number of changes shall be reduced to 2 occasions in line with the seasonal changes.

comment

1193

comment by: *Sven Freisenich***FTL(b) Operator responsibilities NOMINATION OF HOME BASE**

Change "12 calendar months" by "one calendar year".

Additionally: home base changes in excess of 4 times in any calendar year can be mutually agreed between operator and crew member.

comment

comment by: *Gordana BOBERIC*

The operator should take action to change a schedule or crewing arrangements where the actual operation exceeds the maximum flight duty period, during a scheduled seasonal period, by more than:

Replace: arrangements, the latest

Reason: The AMC as proposed initially by the Agency is less restrictive than the corresponding OPS in Subpart Q EU OPS; its intention should be to correct schedule or crewing arrangements as soon as the operator realizes that a certain flight operation exceeds the maximum flight duty period in a significant number (33%) of scheduled flights and not after completing an entire season.

comment 2845 comment by: Civil Aviation Authority of Norway

The scheduled seasonal period should be defined. We suggest a 3 months period.

comment 3114 comment by: BALPA

Asking crews to move "Home base" four times in 12 calendar months is totally unrealistic and unreasonable.

Please define "operational necessities".

comment 3564 comment by: KLM Cityhopper

**Comment:**

The wording is different from Subpart Q of EU-OPS. Suggest to retain previous wording to avoid any misunderstanding.

**Proposal:**

*Planned schedules must allow for flights to be completed within the maximum permitted flight duty period. To assist in achieving this operators will take action to change a schedule or crewing arrangements at the latest where the actual operation exceeds the maximum FDP on more than 33% of the flights in that schedule during a scheduled seasonal period.*

comment 3837 comment by: IACA International Air Carrier Association

Change "12 calendar months" by "one calendar year".

Additionally: home base changes in excess of 4 times in any calendar year can be mutually agreed between operator and crew member.

comment 4063 comment by: Ryanair

Comment.

THERE IS NO BASIS IN SAFETY IN LIMITING CHANGES OF HOME BASE. THIS APPEARS TO BE AN INDUSTRIAL RELATIONS ISSUE AND IS NOT APPROPRIATE HERE.

Proposal

Delete " If operational necessities require the change of home base, it should not be changed more than 4 times in any given period of 12 calendar months"

comment 1194 comment by: *ECA - European Cockpit Association*

Comment on AMC OR.OPS.015.FTL(I): change wording as follows:

**An operator may not plan a flight duty to end later than 30 minutes prior to the maximum allowable flight duty limit unless recent statistics or operational experience prove that the standard deviation from the planned FDP (i.e. root mean square deviation) is less than these 30 minutes and the planned FDP can reasonably be expected not to exceed the applicable limit. In this case the operator may plan to stay short of the maximum allowable flight duty limit by not less than this standard deviation.**

Justification:

The quote of 33% (15%, 10%) is not really the issue. The real problem is the rule's built-in possibility for misuse which undermines the given flight duty limits and makes CS.FTL.1.160 a standard means of operation.

A day to day operation will always show a certain variation in sector length for a specific flight. This variation may depend on the type of operation and scheduling season as well as on other operational factors. The total number of flights observed statistically forms a Gauss-curve which is characterized by its standard deviation.

The rule allows an operator to move the relevant Gauss-curve to some extent beyond the limits which factually establishes a higher FDT limit than

anticipated in the regulation. The 33% and the individual standard variation provide the margin how far the limit could be extended. Thus an operator with a narrow Gauss curve cannot go as far as an operator with a wide gauss curve! At last, the less reliable operator with the wider spread is less restricted than the well organized operator. In other words, from this side there is little incentive to perform on time.

The rule however should reward a flight operation which is driven by the goal to reduce the total amount of delay as well as excessive individual delay.

The rule is ambiguous as it lacks the definition for which type of operation forms a "commercial charter and taxi operation". Thus it is unclear to who applies which limit. Further, it is the nature of the operation of charter and taxi operators not to have a regular operation in regards to flights and destinations. Thus it is unclear on which base the statistics shall be formed. This applies even more to (3) "... all other cases".

**Additional explanation:**

We refer to the normal probability curve or Gauss error distribution curve which provides the estimated probability that a specific flight will encounter a specific amount of delay. A narrow curve implies that a specific operator is typically very close to its schedule where as a wide curve implies that an operator typically encounters a wide variation of arrival times in regard to its schedule. The proposed wording rewards the organized and reliable operator as flights may be scheduled very tight to the limits.

Assuming a Gaussian distribution (normal curve distribution) the proposed wording establishes a limit which does not allow an operator to exceed the given limits by more than 16% (The standard deviation defines a variation which encloses 68.27% of all block times; the remaining 31.73% of the flights are either shorter or longer. The standard variation is a statistically widely used value and well defined, easy to track and simple to program.

There are no guidelines as to how often this data will be interrogated or acted upon. For example, addressing the issue at the end of a scheduled series will be too late to react!

To avoid such situations, preventative measures would be of more use. Operators should ensure that a buffer is incorporated to reduce the possibility of small delays requiring discretion to be used. This would avoid the need for reactionary adjustments to flight schedules.

Delete "...and be a full partner in the development and implementation of the FRMS;"

Motivation: individual crew members are duly represented, see GM OR.OPS.025.FTL Fatigue Risk Management System (FRMS) and GM OR.OPS.325.FTL Fatigue Risk Management System (FRMS) 2.2 "...An FRMS should therefore be based on a partnership approach for which there is agreement between the operator, competent authority and crew member representatives."

comment 1212 comment by: ECA - European Cockpit Association

Comment on GM OR.OPS.025.FTL and GM OR.OPS.325.FTL(6):

Add provisions for ULR operations

Justification:

There are no further rules or provisions on how to operate ULR. It should be stated that rule may be developed once ULR operations become relevant.

comment 1213 comment by: ECA - European Cockpit Association

Comment on GM OR.OPS.325.FTL(4):

Add new provision :

4 Essential components of an FRMS

[...]

**4.3 (new): A Fatigue Management Steering Group (FMSG), established by the operator, responsible for coordinating all fatigue management activities within the organisation, and incorporating representation of all stakeholder groups, including crew member representatives.**

Justification:

See comment on OR.OPS.325.FTL.

For the proper functioning of FRMS - which are still a new concept for most airlines - an effective FMSG is a MUST. GM OR.OPS.325.FTL stipulates that a FMSG is a "basic requirement" for commercial operators. It is therefore not understandable why the Agency omitted this essential part, when listing the "essential components" under GM OR.OPS.325.FTL.

comment 1564 comment by: British Airways

Please remove complete section until ICAO have provided greater detail on requirements.

The proposal to require a Fatigue Risk Management System (FRMS) will lead to endless social tension/discussions and huge costs for the airlines whereas it does not reflect the fact that FRMS is only proposed (as draft) by ICAO for specific type of flights (i.e.. Ultra Long Range Flights - currently not operated by EU airlines) that go beyond the limits of prescriptive FTL schemes such as Subpart Q of EU-OPS. Whether or not to implement an FRMS should therefore remain an individual airline's decision to get additional flexibility for specific flights.

comment 1687 comment by: TAP Portugal

**Relevant Text:**

**Comment:**

EASA's role is to deal with safety rather than dealing with social negotiations which are a matter for individual airlines and their trade unions. The prescriptive guidance material is based on a purely theoretical concept which does not recognize the fact that fatigue is only one (minor) input into an airline's Safety Management System along with other more important potential safety hazards. The AEA therefore urges EASA to withdraw this ill-conceived guidance material which will lead to social problems/discussions which will not improve safety whereas the implementation of those theoretical concepts would lead to huge organizational costs for airlines.

We support the implementation of FRMS within the industry. However, the content of the recent ICAO working paper (and its evolutions) must be used as the authoritative document. Additionally, a FRMS needs to develop as valid scientific data becomes available.

**Page 117 :**

The first paragraph leads to an open question as to which of those requirements apply or do not apply, and to what extent. Part OR does not contain (nor does Part AR) any guidance on how to address proportionate to the type, size and complexity of their operation. Operators will have a difficult time to evaluate the impact of the requirement if they cannot estimate what the requirement means.

comment

3223

comment by: DGAC

**Page 118:**

The text mentions "scientific principles and knowledge", "sound methods of data collection and analysis" and "suitable methodologies". The text does not explain what those principles and knowledge are, what "sound" or "suitable" means. This will lead to non acceptable variability in FRMS implementation as well as acceptance (part AR does not contain any indication either) DGAC is in the process of publishing an implementation guide for operators and surveillance guidance for the authority. We would be ready to share those with EASA in due time (end 2009).

What happens should the partners not achieve an agreement ? Who will arbitrate ? Many operators have already a system in place, but are afraid that the FRMS as written might downgrade it to social negotiation.</p> <p>Replace „any 12 consecutive calendar months“ by „one calendar year“ i.a.w. Subpart Q of EU-OPS Q.</p> <p>The “900 hours in any 12 consecutive months” are not specified by ICAO and is more restrictive than the EU Working Time Directive EC 2000/79 Clause 8: “Without prejudice to Clause 3, mobile staff in civil aviation shall be given days free of all duty and standby, which are notified in advance, as follows: a) at least seven local days in each calendar month, which may include any rest periods required by law; and b) at least 96 local days in each calendar year, which may include any rest periods required by law.</p> <p>The Working Time Directive regulates the 4 weeks holidays on a yearly basis, not on any 12 consecutive months. Hence, it is possible to have two times 4 weeks in 12 consecutive months, where it would not be appropriate to fly 900 hours. Otherwise, one could have no holidays and should be allowed to fly more than 900 hours in these 12 consecutive months. Changing from calendar year to 12 consecutive months implies a complete change of all systems...</p> <p>Air Berlin is highly subject to seasonal effects, e.g. peak during summer season. The “one calendar year” as in EU-OPS and Working Time Directive (Council Directive 2000/79/EC) reduces the problem to a one-time exercise at the end of the calendar year, i.e. in the winter low season. The EASA proposed</p>

"12 consecutive months" presents however an unnecessary continuing exercise, also during the summer peak, without any safety benefit and which will lead to reduced flexibility in particular when planning crew members' leave. Note that this summer peak is not driven by the operator, but by the market itself, e.g. hard working families and tax payers going on well deserved summer holidays.

Finally, Certification Specification CS FTL.1.140 (a) and (b)(1) will avoid any intended abuse of the "one calendar year". The intent is already covered by 1.140 (c).

 Comment on GM OR.OPS.325.FTL: Transfer to AMC.  
  
 Justification:  
 These concepts and provisions are based on ICAO material. Until they are completed or amended by pertinent material, they are deemed to be the sole base of support for a proper FRMS. Furthermore, it is namely stated in this material that a successful FRMS relies on the implementation of all relevant aspects rather than selective elements.

Comment on GM OR.OPS.325.FTL:

Add provision as follows :

4 Fatigue Management Steering Group.

**k. Development of agreed processes and procedures for data collection.**

**l. Confidential dissemination and sharing of data for discussion within the group.**

Justification:

In line with international best practice, ICAO working paper and IFALPA recommendation.

comment

1218

comment by: ECA - European Cockpit Association

Comment on GM OR.OPS.325.FTL:

Add provision as follows at the end of the paragraph 4 Fatigue Management Steering Group

Information sources for the FMSG should include the following:

a. Initiated by others:

i. Voluntary fatigue reports

ii. Monitoring of calls reporting "too fatigue" to take duty

iii. Fatigue related incident reports

iv. Internal and external audit reports

v. Periodic expert review of the FRMS

**b. Initiated by the FMSG:**

**i. Planned versus actual work ( i.e. rostered/scheduled duty versus actual duty, trip swapping, use of reserve and standby).**

**ii. Roster modeling.**

**iii. Fatigue data acquisition (e.g. questionnaires, diaries, actigraphy, performance testing).**

**iv. Objective flight data.**

**v. Audit of unplanned events (delays, diversions, captain's discretion, etc.).**

**vi. Tracking of absenteeism.**

Justification:

In line with international best practice, ICAO working paper and IFALPA recommendation.

comment

We support the implementation of FRMS within the industry. However, the content of the recent ICAO working paper (and it's evolutions) must be used as the authoritative document. Additionally, a FRMS needs to develop as valid scientific data becomes available.

**Relevant Text:**

GM.OR.OPS.025.FTL (FRMS), GM.OR.OPS.325.FTL (FRMS),  
AMC.OR.OPS.025.FTL(b) (FRMS), GM.OR.OPS.325.FTL (FRMS)

**Comment:**

EASA is role is to deal with safety rather than dealing with social negotiations which are matter for individual airlines and their trade unions. The prescriptive guidance material is based on a purely theoretical concept which does not recognize the fact that fatigue is only one (minor) input into an airline's Safety Management System along other more important potential safety hazards. The AEA therefore urges EASA withdraw this ill-conceived guidance material which will lead to social problems/discussions which will not improve safety whereas the implementation of those theoretical concepts would lead to huge organizational cost for airlines.

4.  
Same comments as under OR.OPS.025.FTL

Delete this overly prescriptive GM. Fatigue is being considered by the operator's SMS and does not warrant a dedicated FMSG.

Furthermore, the partnership between operators and crew representatives need to be clarified. What happens should the partners not achieve an agreement ? Who will arbitrate ? Many operators have already a system in place, but are afraid that the FRMS as written might downgrade it to social negotiation.

**AMC OR.OPS.330.FTL (c)(6) - Flight Time Specification Schemes**

**Comment**

There is no basis in safety for discussing scientifically proven FTL Schemes with scheduling managers, crew member representatives, etc who do not possess the technical expertise to assess same. This is not an essential safety requirement. This is an industrial relations matter.

**Proposal**

(b) DELETE

comment 688 comment by: *easyjet safety*

Comment: The Flight Time Specification Scheme is a safety document and does not require consultation with affected groups as this is an industrial and contractual process .The need for effective review and oversight is recognised but should be in the context of the operator's FRMS. .

Proposal: Approval of an individual flight time specification scheme by the competent authority will take into account the the scope and capability of an operators FRMS. Additional prescriptive regulation may be required in relation to the maturity, robustness and functionality of an operator's FRMS."

comment 709 comment by: *Civil Aviation Authority of Norway*

It seems to some extent unclear what is meant by ".a hazard analysis and risk management log". It should therefore be added a better description of what is intended.

 Comment on AMC OR.OPS.330.FTL(c):  
 (b) The details regarding consultation with the affected **groups stakeholders** should describe the consultation with scheduling managers, crew member representatives, etc., as applicable. **Crew member representatives' observations on the individual scheme shall be documented in detail, including contact details of the relevant representatives.**  
 Justification:  
 See comment on OR.OPS.330.FTL (c) (6)
- comment 1604 comment by: *British Airways*  
 This appears to be a very complicated process to justify to the competent authority why an operator requires a Flight Time Specification scheme.  
 Why does it require the details of "consultation" with affected groups especially "crew member representatives", surely its for the operator to agree a scheme with their competent authority.

comment by: Sven Freisenich

Replace „any 12 consecutive calendar months“ by „one calendar year“ i.a.w. Subpart Q of EU-OPS Q.

The “900 hours in any 12 consecutive months” are not specified by ICAO and is more restrictive than the EU Working Time Directive EC 2000/79 Clause 8:

“Without prejudice to Clause 3, mobile staff in civil aviation shall be given days free of all duty and standby, which are notified in advance, as follows:

a) at least seven local days in each calendar month, which may include any rest periods required by law; and

b) at least 96 local days in each calendar year, which may include any rest periods required by law.

The Working Time Directive regulates the 4 weeks holidays on a yearly basis, not on any 12 consecutive months. Hence, it is possible to have two times 4 weeks in 12 consecutive months, where it would not be appropriate to fly 900 hours. Otherwise, one could have no holidays and should be allowed to fly more than 900 hours in these 12 consecutive months. Changing from calendar year to 12 consecutive months implies a complete change of all systems...

LTU is highly subject to seasonal effects, e.g. peak during summer season. The "one calendar year" as in EU-OPS and Working Time Directive (Council Directive 2000/79/EC) reduces the problem to a one-time exercise at the end of the calendar year, i.e. in the winter low season. The EASA proposed "12 consecutive months" presents however an unnecessary continuing exercise, also during the summer peak, without any safety benefit and which will lead to reduced flexibility in particular when planning crew members' leave.

Note that this summer peak is not driven by the operator, but by the market itself, e.g. hard working families and tax payers going on well deserved summer holidays.

Finally, Certification Specification CS FTL.1.140 (a) and (b)(1) will avoid any intended abuse of the "one calendar year". The intent is already covered by 1.140 (c).

comment

1220

comment by: ECA - European Cockpit Association

Comment on AMC OR.OPS.040.FTL(a):

This text is duplicated in both OR.OPS.040.FTL (a) and (b) without the word "should" in case (b) is not deleted (see comment 1221).

Justification:

The intention of the rule "as evenly as practicable" must be specified.

According to Directive 2003/88/EC Article 6 the maximum number of working hours per week is 48 for a normal worker. The Working time Directive (Directive 2000/79/EC) sets a maximum annual working time of 2000 hours "... spread as evenly as practicable." This means that the "standard" working week should not exceed 42h. Therefore, exceeding the 42 hours should be exceptional and duly justified and shall never pass the 48 hour limit. Additionally a 14 day limit could be introduced.

comment

1221

comment by: ECA - European Cockpit Association

Comment on AMC OR.OPS.040.FTL(b): this paragraph should be deleted (see comment 1111). In case it is maintained, change as follows:

(b) In addition to the time periods specified in OR.OPS.040.FTL, operators may include additional limitations, ~~such as duty hours in any 1-4 consecutive days,~~ if considered useful for fatigue mitigation.

Justification:

See comment on OR.OPS.040.FTL: due to the recommendation of the scientific evaluation an additional limit per 14 consecutive days is incorporated in OR.OPS.040.FTL Flight times and duty periods (a)

comment

1439

comment by: UK CAA

**Page No:** 122

**Paragraph No:** GM OR.OPS.040.FTL

**Comment:** The reference to the Working Time Directive is supported, but it is felt that the reference to "days free of all duty" (Clause 9) should be included here as "days free of duty" as defined in OR.OPS.010.FTL (j).

**Justification:** Consistency and for cumulative fatigue mitigation that these "days off" provide and that is not covered elsewhere in the EASA regulation. It will have the effect, in purely EASA guidance, of highlighting an important element of the Directive.

**Proposed Text (if applicable):**

Add final sentence:

"Days free of all duty and standby in clause 9 of the Directive should conform to the definition in OR.OPS.010.FTL (j)."

The Working Time Directive regulates the 4 weeks holidays on a yearly basis, not on any 12 consecutive months. Hence, it is possible to have two times 4 weeks in 12 consecutive months, where it would not be appropriate to fly 900 hours. Otherwise, one could have no holidays and should be allowed to fly more than 900 hours in these 12 consecutive months. Changing from calendar year to 12 consecutive months implies a complete change of all systems...

LTU is highly subject to seasonal effects, e.g. peak during summer season. The "one calendar year" as in EU-OPS and Working Time Directive (Council Directive 2000/79/EC) reduces the problem to a one-time exercise at the end of the calendar year, i.e. in the winter low season. The EASA proposed "12 consecutive months" presents however an unnecessary continuing exercise, also during the summer peak, without any safety benefit and which will lead to reduced flexibility in particular when planning crew members' leave.

Note that this summer peak is not driven by the operator, but by the market itself, e.g. hard working families and tax payers going on well deserved summer holidays.

Finally, Certification Specification CS FTL.1.140 (a) and (b)(1) will avoid any intended abuse of the "one calendar year". The intent is already covered by 1.140 (c).

Comment on GM OR.OPS.055.FTL:

This text can be removed or reduced to a reference as a more detailed text is found in GM OR.OPS.025.FTL and GM OR.OPS.325.FTL (3.2.) (b).

Justification:

Questions raised and answers given by Moebus Study:

Question 11

What provisions are needed for extend FDP operations with augmented crew and/or time zone crossings? (ref EU OPS 1.1115 para 1.1)

Question 12 quality of rest regarding rest location/ rest facilities for flight crew and cabin crew (ref EU OPS 1.1115 para 1.1 and 1.2)

setting additional restrictions related to augmented crew in respect to the maximum FDP with augmented crew i.e. taking into account quality of the bunk facilities and the effect of crew acclimatization (e.g. FDP may be extended by a period equal to three-quarters of the total rest taken, if in-flight relief and adequate bunk facilities are provided; or equal to half of the total

rest taken if the aircrew is not acclimatized).

To sum up, ECA recommends not to allow extensions of the FDP in case of rest in economy class seats.

comment by: *Air Berlin PLC & Co. Luftverkehrs KG*

Replace „any 12 consecutive calendar months“ by „one calendar year“ i.a.w. Subpart Q of EU-OPS Q.

The “900 hours in any 12 consecutive months” are not specified by ICAO and is more restrictive than the EU Working Time Directive EC 2000/79 Clause 8:

“Without prejudice to Clause 3, mobile staff in civil aviation shall be given days free of all duty and standby, which are notified in advance, as follows:

- a) at least seven local days in each calendar month, which may include any rest periods required by law; and
- b) at least 96 local days in each calendar year, which may include any rest periods required by law.

The Working Time Directive regulates the 4 weeks holidays on a yearly basis, not on any 12 consecutive months. Hence, it is possible to have two times 4 weeks in 12 consecutive months, where it would not be appropriate to fly 900 hours. Otherwise, one could have no holidays and should be allowed to fly more than 900 hours in these 12 consecutive months. Changing from calendar year to 12 consecutive months implies a complete change of all systems...

Air Berlin is highly subject to seasonal effects, e.g. peak during summer season. The “one calendar year” as in EU-OPS and Working Time Directive (Council Directive 2000/79/EC) reduces the problem to a one-time exercise at the end of the calendar year, i.e. in the winter low season. The EASA proposed “12 consecutive months” presents however an unnecessary continuing exercise, also during the summer peak, without any safety benefit and which will lead to reduced flexibility in particular when planning crew members’ leave. Note that this summer peak is not driven by the operator, but by the market itself, e.g. hard working families and tax payers going on well deserved summer holidays.

Finally, Certification Specification CS FTL.1.140 (a) and (b)(1) will avoid any intended abuse of the “one calendar year”. The intent is already covered by

1.140 (c).

comment by: ECA - European Cockpit Association

The whole section on security should be deleted. ECA believes the provisions of the security section should be deleted as they overlap with Regulation 300/2008. If, however it is decided to keep this section within OPS, ECA recommends to change the text (see comments below).

**C. V. Draft Decision (AMC&GM) Part-OR - Subpart OPS - Section IX - GM  
OR.OPS.020.SEC Disruptive Passenger Behaviour**

p. 123-132

comment 131

comment by: Air Southwest

At present the directive from the UK DfT concerning disruptive passengers is vague. The inclusion of GM.OR.OPS.020.SEC is welcomed, if only to show that somebody has thought about this. However, the requirement at OR.OPS.020.SEC placing the responsibility on the Operator to establish the procedures and applicable training without specific instructions or criteria is again vague. Is it intended that EASA will develop AMC for disruptive passenger programmes (thereby assuming some of the responsibilities of the applicable state authority) or will the EC direct the Member States to specify the content of the programme and associated training?

comment 325

comment by: ECA - European Cockpit Association

The whole paragraph should be deleted. ECA believes the provisions of the security section should be deleted as they overlap with Regulation 300/2008 (see comment n° 324). If, however it is decided to keep this section within OPS, the following changes are needed:

This guidance material is provided with regard to the transportation of passengers by commercial air transport operators where appropriate to the size and type of operation. Operators engaged in non-commercial transportation of passengers with complex motor-powered aircraft may also find this guidance material useful. To address the effects of unruly passengers on flight safety, operators should manage and reduce the instances of disruptive passenger behaviour by means of:

- a policy and detailed procedures on the handling of disruptive passengers;
- restraining devices on board the aircraft;
- clearly stated responsibilities of the crew members;
- a warning and reporting system (documents to be on board the aircraft);
- a **defined** communication system between the ground staff and crew members;
- a training programme consisting of initial and recurrent training; and
- a process for the review of disruptive passenger incidents.

**1 Disruptive Passenger Policy**

The operator should establish a policy and procedures on the handling of disruptive passengers which should be supported by the executive management of the operator. The operator should designate a **person or**

**department focal point** responsible for the handling of disruptive passenger incidents. The disruptive passenger policy should be communicated to all staff members that come in contact with passengers, both on the ground and in the air.

Justification:

The proposed text better defines responsibilities.

1.1 The disruptive passenger policy should include ~~information, such as:~~  
~~a. the designated focal point;~~  
~~b. a transparent mechanism to ensure that incidents are well documented;~~

~~a. c.~~ **an transparent** incident reporting system as well as incident management process;

~~b. d.~~ the **documentation recording** of the number and types of incidents occurring over a set period of time;

~~e. the circumstances when actions should be taken; and~~

~~f. the definition and communication of actions to be taken.~~

1.2 The disruptive passenger policy should include provisions:

a. to empower crew members and ground staff to take reasonable steps to prevent disruptive and unruly behaviour and, where it occurs, to deal with it as effectively as practicable;

b. to support crew members and ground staff taking such action;

c. to provide appropriate training to crew members and ground staff in dealing with conflict and its aftermath;

d. to encourage ground staff to detect and report disruptive behaviour at check-in, in the lounges and at the boarding gate in order to prevent such passengers from boarding;

e. to keep crew members and ground staff aware of ~~potentially~~ disruptive passengers; and

f. to pay particular attention to **and have permanent procedures in place to monitor or travel by large** groups of travellers **and have permanent procedures in place to monitor sporting teams' travel**. **Special attention should be paid to groups that are known as disruptive, such as travel to and from sporting and pre-wedding events.**

[...]

### 3 Prevention of disruptive passenger behaviour

Disruptive passenger behaviour is primarily a safety issue. The operator should focus on measures regarding the prevention of ~~(escalated)~~ **all** disruptive passenger behaviour. Dealing firmly and legally with disruptive behaviour may serve as a deterrent, however, in many disruptive incidents, passengers behave irrationally and will not calculate the consequences of their behaviour. The study of disruptive behaviour shows that often a series of events build up to the disruptive behaviour and early signs of potential disruptive behaviour can be observed. The focus of an operator's policy should be first on prevention by acting on these early signs, rather than dealing exclusively with the escalated incident. Research further indicates that many incidents (and those which tend to be particularly violent) are related to excessive alcohol consumption, as well as to nicotine withdrawal symptoms of smokers. The operator should take a responsible approach with regards to the serving of alcohol on board, and should provide alternatives (such as nicotine gum) for smokers.

[...]

### 6.1 Location of restraint devices

When passenger restraints are carried on an aircraft they should be kept in a secure location ~~such as~~ **anywhere other than** the cockpit and only used ~~with the express prior consent of~~ **in consultation with** the pilot in command when all the circumstances of the incident are evaluated. ~~Consideration may need to be taken into account when locked cockpit door policies are in place.~~ The pilot in command should communicate his/her decisions to the ~~operations department~~ **appropriate ground agency** as soon as possible so that suitable arrangements are made when the aircraft lands.

[...]

### 7.1 Staff empowerment

Ground support and passenger services staff **are** often ~~is~~ the first to notice a potentially disruptive passenger. Their procedures and training should ensure that minor complaints do not escalate into major incidents. On those occasions when tact, reassurance and interpersonal skills fail to resolve an incident, it is vital that staff members have guidance identifying and handling these behaviours. This is also true for crew members. All staff members in direct contact with passengers must have a mandate from the operator to implement the appropriate procedures to protect themselves and other passengers.

[...]

### 7.3 Relief programmes

When an incident occurs, there can be lasting effects on the staff involved. Relief programmes for victims of disruptive passenger behaviour aim at recovery from those incidents. A distinction can be made between a serious incident (e.g. a physical altercation, being threatened with a knife) and less serious incidents (e.g. verbal abuse). The seriousness of the incident depends on how it was experienced by the victim. Usually serious incidents will be recognised by colleagues and brought to the attention of **management appropriate instances**. Professional counselling should be **considered offered**. Less serious incidents cause less stress and emotional trauma to the victim, and therefore professional counselling may not be called for, and may even be counterproductive in this type of instance. However, if verbal abuse occurs frequently, the normal recovery time will likely be disturbed by these new incidents. There will be a build-up of stress, and recovery time is called for to prevent an extended period of illness. This recovery may take the form of group discussions with colleagues in addition to professional guidance.

Justification:

Management is not the right place: medical or health agencies are.

## ~~8 Persons Travelling under Special Status~~ **Deportees, inadmissible persons and those in lawful custody**

~~8.1 The policies and procedures for the handling of disruptive passengers should give consideration to persons of potentially disruptive passenger behaviour travelling under special status, such as~~ **Policies and procedures should be in place for** deportees, inadmissible persons and ~~persons those~~ **persons those** in lawful custody ~~which who~~ **which who** are obliged to travel due to judicial or administrative proceedings.

8.2 Tickets and other travel documents including baggage identification tag(s), health certificates, etc. of ~~persons travelling under special status these persons~~ **persons** should be carried ~~by the PIC in the charge of a crew member~~

**until disembarkation.**

comment by: ECA - European Cockpit Association

Comment on appendix 1 to GM OR.OPS.020.SEC, page 129: this section should be deleted. ECA believes the provisions of the security section should be deleted as they overlap with Regulation 300/2008 (see comment n° 324). If, however it is decided to keep this section within OPS, the following changes are needed:

~~**INFORM OPERATIONS**~~ (.....)

Justification:

It should go to the appropriate instance, operations or other.

LEVEL II (following Level I Verbal Warning)

Passenger Information

Name Seat Number

Nationality Passport (country and number)

Address

Description of Incident

Name of Pilot in Command Employee Number

~~**Phone Signature**~~

LEVEL III

Witness Information (Witness can be another crewmember)

Name Seat Phone

Address

Name Seat Phone

Address

Pilot in Command (involved) Name Employee Number

~~**Phone Signature**~~

Justification:

Not needed.

Your behaviour may be in violation with the law.

Your immediate cooperation is required if you wish to avoid prosecution and removal from this aircraft at the next point of arrival.

The law and international aviation regulations prohibit e.g. the following:

- \* Smoking in the lavatory or smoking while the no smoking light is on;
- \* Interference with a crewmember or creating an alcohol related disturbance;
- \* Drinking any alcoholic beverage unless served by a crew member;

If you do not refrain from these activities, you **will-may** be prosecuted.

Aviation Law provides for civil monetary fines and in some cases, imprisonment.

Justification:

It is not up to the PIC or the airline to decide.

comment

comment by: ECA - European Cockpit Association

Comment on appendix 2 to GM OR.OPS.020.SEC, page 130: this section should be deleted. ECA believes the provisions of the security section should be deleted as they overlap with Regulation 300/2008 (see comment n° 324). If, however it is decided to keep this section within OPS, the following changes are needed:

2 VIOLATION UNACCEPTABLE BEHAVIOUR ON BOARD AN AIRCRAFT  
 You have already been told by the crew members that your behaviour on board this aircraft is unacceptable ~~and may have been in violation of applicable law.~~

Justification:  
 Not necessarily

Comment on the following (in bold) sentence:

With immediate effect:

1. You must not drink any alcohol
2. You must hand all alcohol in your possession to a crew member (it will be returned to you when you leave this aircraft)
- 3. You must not behave in a manner likely to:**
  - **endanger the safety of the aircraft**
  - **cause concern to the crew or other passengers.**
4. You must comply with the crew's instructions.

Comment:

Not definable action, can create discrimination and is hardly policeable.

VIOLATION

If you fail to comply, the pilot in command may decide to land the aircraft at the nearest available location and off load you; you ~~may will~~ be liable for the diversion costs and your ticket ~~will could~~ be invalidated for further carriage.

3 SAMPLE — FINAL WARNING

Your behaviour appears to be in violation of [Country] law. If you ~~fail to control your actions continue with this behaviour~~, police authorities will be notified and requested to meet this flight.

This is a warning that [Country] law prohibits the following:

1. Assaults, threats, intimidation or interference with a crew member in performance of ~~their the crew member's~~ duties ~~onboard an aircraft being operated.~~
2. Disruptive behaviour ~~due to alcohol consumption.~~
- ~~3. Alcohol related disturbance created by passenger~~
- ~~4. Consumption of alcoholic beverages unless served by a crew member~~
- ~~5. Alcohol service to passengers who appears to be intoxicated~~

~~3. 6.~~ Failure to follow instructions given by a crew member regarding compliance with passenger safety regulation such as the following:

- no smoking in lavatories at any time
- no smoking when "NO SMOKING" sign is illuminated
- tampering with, disabling or destroying smoke detector installed in any airplane lavatory
- requirement to keep seat belt fastened while the "FASTEN SEAT BELT" sign is on
- operation of an electronic device when prohibited.

If you fail to comply, the pilot in command may decide to land the aircraft at the nearest available ~~location airport~~ and off load you; you ~~will may~~ be liable for the diversion costs and your ticket ~~will could~~ be invalidated for further carriage.

On arrival detail of your conduct will also be reported to the police ~~for possible~~ ~~who may commence~~ prosecution ~~proceedings~~.

This notice is given by the pilot in command of the aircraft.

- comment 328 comment by: ECA - European Cockpit Association
- Comment on appendix 3 to GM OR.OPS.020.SEC, page 132: this section should be deleted. ECA believes the provisions of the security section should be deleted as they overlap with Regulation 300/2008 (see comment n° 324). This should be part of security training in total. To be covered by Regulation 300/2008.
- comment 621 comment by: *claire.amos*
- clarification required: Is the intention that restraining devices become mandatory equipment to be carried onboard? This is assumed that not all these requirements are mandatory
- comment 907 comment by: *claire.amos*
- Your behaviour may be in violation **with** the law.  
Incorrect English - replace "with" with "of"
- \* Drinking any alcoholic beverage unless served by a crew member;**  
It may be good practice to prohibit this but I don't think that this is unlawful to drink your own alcohol.
- comment 910 comment by: *claire.amos*
- Disruptive Passenger** -  
Heading should be changed to " Unruly Passenger". This is the recognised phrase and reflect the text.
- comment 911 comment by: *claire.amos*
- Training should be outcome driven not time dependant. Delete the durations. ie:
- Initial Training: 1 day (8 hours)**  
**Annual Recurrent Training: 1/2 day (4 hours)**
- comment 1059 comment by: AEA
- Relevant Text:**  
Appendix 3  
**Comment:**  
As the revision of the implementing legislation of EU Regulation 300/2008 has not been even finished yet and is therefore absolutely up-to-date we strongly argue that EASA OPS must not - if at all - address security topics in a different way than it has already been finalised in regulation 300/2008 and the implementing legislation. For example EASA OPS contains requirements for security programmes of airlines, security training and even for aircraft checks that differ and are not in line with EU Regulation 300/2008 and its implementing legislation. If EASA OPS would also regulate a security and training programme it should then be clearly stated which authority is responsible for the "certification process" (EASA, national authorities, etc?). Furthermore EASA OPS has no distinction between training for crew members and ground staff - in contrast to regulation 300/2008 and its implementing legislation which refer to dedicated groups of persons (persons implementing

security controls, persons implementing access control, persons implementing baggage reconciliation, etc.). Besides "ground staff" is per se not definable: only ground staff which deals with flights from an operational perspective?  
The amount of annual recurrent training is overdone

**Proposal:**

We should strongly argue for a "harmonisation" of both text meaning that EASA OPS should not regulate security issues or at least regulate them in the same way than EU regulation 300/2008 and its implementing legislation do. Like concerning chapter 10 on in-flight security the European Commission and EASA should clearly define their responsibilities to protect the aviation industry from different requirements and a security regime which is not consistent at all.

If EASA OPS would also regulate a security and training programme it should then be clearly stated which authority is responsible for the "certification process" (EASA, national authorities, etc?). Furthermore EASA OPS has no distinction between training for crew members and ground staff - in contrast to regulation 300/2008 and its implementing legislation which refer to dedicated groups of persons (persons implementing security controls, persons implementing access control, persons implementing baggage reconciliation, etc.). Besides "ground staff" is per se not definable: only ground staff which deals with flights from an operational perspective? The amount of annual recurrent training is overdone

**Proposal:**

We should strongly argue for a "harmonisation" of both text meaning that EASA OPS should not regulate security issues or at least regulate them in the same way than EU regulation 300/2008 and its implementing legislation do. Like concerning chapter 10 on in-flight security the European Commission and EASA should clearly define their responsibilities to protect the aviation industry from different requirements and a security regime which is not consistent at all.

comment by: *Ryanair*GM OR.OPS.020.SEC

The term "potentially disruptive passenger" in the context of Regulation (EC) 300/2008 means a "passenger who is either a deportee, a person deemed to be inadmissible for immigration purposes, or a person in lawful custody". Although we cannot find any definition of the term "disruptive passenger" in Regulation 216, it is clear that the term "disruptive passenger" is used in a much wider context. This anomaly must be addressed and any confusion removed.

"Restraining devices" and "warning system" - operators have, on the basis of operational experience, invested heavily in the development of effective policy and procedures for handling disruptive passengers. These procedures may not require the use of either "restraining devices" or a "warning system" as described therefore, references to both must be removed. Nothing in these Regulations/AMCs/GM must be interpreted as mandating the use of either restraining devices or a warning system.

comment

2310

comment by: *Ryanair*

2.1 - should be amended as follows to ensure uniformity with GM OR.OPS.020.SEC, Para 1

"The operator should inform all staff members that come into contact with passengers both on the ground and in the air about the ....."

2.2 - the operator is not the only entity that is responsible for passenger communication and education. This paragraph requires amendment to include State, Airport etc responsibilities.

3 - Operators have no responsibility for providing nicotine replacement therapy to passengers - this must be removed.

3.1.b - This paragraph must be removed. It incorrectly implies that operators are responsible for/have control over flight delays/disruptions.

3.1.d - this is also an airport security and law enforcement agency responsibility. Operators may not be aware of incidents or disruptions which occur prior to boarding.

comment

2311

comment by: *Ryanair*

"...and in the worst case, restraint" must be removed. Operators have, on the basis of operational experience, invested heavily in the development of effective policy and procedures for handling disruptive passengers. These procedures may not require the use of either "restraining devices" or a "warning system" as described therefore, references to both must be removed. Nothing in these Regulations/AMCs/GM must be interpreted as mandating the use of either restraining devices or a warning system.

Mandating procedures that require the physical restraint of disruptive passengers by cabin crew members could in fact put the aircraft, crew members and passengers at greater jeopardy.

#### Paragraph 4

This section requires amendment to remove all references to a "warning system" (written or otherwise) and the use of restraining devices for the reasons specified above.

comment

2313

comment by: *Ryanair*

#### 6 - The role of the pilot in command

"Restraining devices" - operators have, on the basis of operational experience, invested heavily in the development of effective policy and procedures for handling disruptive passengers. These procedures may not require the use of "restraining devices" therefore, references must be removed. Nothing in these Regulations/AMCs/GM must be interpreted as mandating the use of restraining devices.

#### 6.1 - Location of restraint devices

Remove reference to "such as cockpit" - cockpit must remain secure (locked

door policy). Otherwise a disruptive passenger event could be exploited.

7 - Reporting of disruptive passenger incidents and required documentation for prosecution

The term 'flight disturbance incident report' is misleading and should be changed to 'disruptive passenger report'. The sample report form (Appendix 1) is too prescriptive, is based on a warning system and the use of restraints and therefore must be removed.

7.2 - Training Requirements

Security training requirements are already specified in and mandated by Regulation (EC) 300/2008, Chapter 11. Nothing in OR.OPS, Section IX shall conflict with these requirements.

comment

2314

comment by: *Ryanair*

Reference to "physical breakaway and controlling skills" in Section (h) must be removed - ground staff and crew should be trained in de-escalation techniques. Self defence type training is not appropriate.

Reference to "restraint device training" and "restrained passenger welfare" in Sections (i) and (j) should be amended as follows:

- (i) restraint device training *(if applicable)*
- (j) restrained passenger welfare *(if applicable)*

7.3 - Relief programmes

This section is over prescriptive, could be counterproductive and should be removed. Operators are responsible for developing internal procedures to take account of such situations.

8 - Persons travelling under Special Status

This would appear to relate to the Regulation (EC) 300/2008 definition of a "potentially disruptive passenger". Any anomaly and potential confusion between 300/2008 and Regulation 216 must be removed. We cannot locate the term "persons travelling under special status" in any piece of Security Legislation.

9 - Note

There is no reference to European Community Security Legislation Regulation (EC) 300/2008.

All references are to restricted ICAO and ECAC documents which are not readily accessible to all operators.

comment

2315

comment by: *Ryanair*

The term 'flight disturbance incident report' is misleading and should be changed to 'disruptive passenger report'.

comment

2316

comment by: *Ryanair*

Any reference to time allocation for training (e.g. 8 hours/ 1/2 day) is irrelevant, could be counterproductive and must be removed. Effective training is the goal.

"Appropriate measures to contain aggressive behaviour" - this requires further clarification - ground personnel and crew must be trained in de-escalation techniques. Self defence type training is not appropriate.

"Knowledge of measures to contain aggression" - this requires further clarification - ground personnel and crew must be trained in de-escalation techniques. Self defence type training is not appropriate.

comment

2462

comment by: *Virgin Atlantic Airways*

**Comments**

Are these guidelines likely to become a rule and if so will it supersede the national requirements for training?

**Proposed Text:**

The training programme established by a commercial operator must include the following elements if applicable;

- a) determination of the seriousness of any occurrence;
- b) crew communication and coordination;
- c) appropriate self- defence responses
- d) use of authorised protective devices;
- e) understanding of behaviour of terrorists so as to facilitate the ability of crew members to cope with hijacker behaviour and passenger responses;
- f) Live situational training exercises regarding various threat conditions;
- g) Cockpit procedures to protect the aircraft; and
- h) Aircraft search procedures and guidance on least risk bomb locations where practicable.

b.

This paragraph should be withdrawn as it implies that all these are all Air carriers fault and that these situations can definitively be resolved as they are under the direct control of airlines – other issues such as adverse weather, airport congestion, industrial action, ATC delays, security screening procedures can all equally 'frustrate' passengers.

3.1.

d.

This is also an airport security and police issue (many operators are not aware of incidents of disruption prior to boarding).

It is primarily a member state control authority issue to evaluate and analyse both mandatory and non mandatory reports.

6.1

Remove 'such as the cockpit' – As locked door policy is mandated OR.OPS.035.SEC cockpit must remain secure; terrorists could use simulated 'disruptive' behaviour in the knowledge this may open secure flight deck doors. No mandate should be envisaged to carry restraints – they are not appropriate for all commercial aircraft types

comment 3402 comment by: *BDF - German Airline Association*

Security Training programmes are already mandated in the Chapter 11 of EU 300/2008 – EASA section IX should be amended to reflect this.

Paragraph 1.2 c: Training Programmes for crew members and ground staff are already dealt with by Regulation (EC) 300/2008 which states that ground staff

training is a responsibility of the airport. External Handling Agents who work for more than one airline would have to be trained again by each airline, since this proposal is only reflecting the responsibilities of the airline.

Paragraph 1.2 f: Why is group travelling so special? A small group can be as inconspicuous as a single person.

Paragraph 3 and 3.1: Since prevention of disruptive passenger behaviour is a complex issue and since the prevention of disruptive passenger behaviour is often beyond the operator's influence the measures taken and training obligations should not only be up to operators. Especially in regards to reporting most countries stipulate responsibilities for their authorities. The operator is often not aware of incidents prior to boarding. Therefore these paragraphs should be withdrawn.

Paragraph 5: This paragraph consists of redundant information, since paragraph 4 already covers the important categories.

Paragraph 6.1: Keeping the restrained devices in the cockpit contradicts with the flight deck door policy. A disruptive behaviour could be initiated, in order to have the door opened.

Paragraph 7.2: The personnel for which the training programme shall be applied is not reflecting the responsibilities of other companies involved (such as the airports) for staff training.

Paragraph 8: Persons travelling under special status is already covered in Regulation (EC) 300/2008, 4.3. Therefore there is no need to cover this issue again, as stated before.

comment by: Antonio Sousa

A disruptive/unruly passenger means *"a person who commits on board a civil aviation aircraft, from the moment when the aircraft door is closed prior to take-off to the moment when it is reopened after landing ...."* (ECAC Doc. 30, ICAO Tokyo Convention)

EASA extends this concept to airport terminals, check-in counters and boarding gates and holds the air carrier responsible for the handling of this kind of passengers (adequate training is mandated) . The present concept shall be kept thus any disruptive passenger behaviour out of the aircraft shall be considered as a public order issue and under the responsibility of the airport authority and police forces.

Furthermore crew should continue to be trained in de-escalation techniques and not on self defence martial arts and use of "authorised protective devices".

comment

comment by: Antonio Sousa

Warning to passenger – ECAC Doc. 30, Annex IV-4-C, Attachment II clear defines the kind of warnings that should be given to the disruptive passenger. These warnings shall be **signed** by the pilot in command. The word *"given"* is not appropriate, it may lead to confusion (physically given by the pilot in command).

comment

3769

comment by: Antonio Sousa

Categorising of disruptive passengers' incidents – ECAC Doc. 30, Annex IV-4-C,

Attachment I clear defines the 3 levels for passenger disturbance reports actually in use and adopted by Member States authorities and air carriers. Introducing a new scheme as per NPA 2009 2-c, paragraph 4, page 125, will increase misunderstanding and confusion.

comment

comment by: Rui Sarmento

In acordance with ECAC Doc 230, Tokyo Covention and ICAO, a disruptive/unruly passenger is " a person who commits on board a civil aviation aircraft, from the moment when the aircraft door is closed prior to take-off to the moment when it is reopened after landing". EASA isnow extending this concept to airport terminals, chec-in couters and boarding gates, holding the air carrier responsible for the handling of these passengers (adequate training is mandated). The actual concept (ECAC Doc 230, Tokyo Covention and ICAO) shall be kept thus any disruptive passenger behaviour out of the aircraftshall be considered as a public order issue and under the responsibility of the airport authority and police forces.

Crews cshould continue to be trained in de - escalation tecniques and not on self defense martial arts and use of #authorized protective devices".

WARNING to PASSENGER - ECAC Doc 30, Annex iv-4-C, attachment II clearly defines the kind of warnings that should be given to a disruptive passenger. These warnings shall be SIGNED by the pilot in command. The word here used "given", is not appropriate, it may lead to confusion and indicate that it shall be FHYSCALLY given by the pilot in command.

When categorising disruptive passengers incidents - ECAC Doc 30, ANnex IV - 4-C, Attachment I clear defines the 3 levels for passenger disturbance reports actually in use and adopted by Member State authorities and air carriers. Introducing a new scheme as per NPA 2009 2-c, paragraph 4, page 125, will increase misunderstanding and confusion

In paragraph 6.1, Location of restraint devices- these devices shall never be considered to be kept/placed "in a secure place such as the cockpit". Cockpit doors shall remain closed/blocked during flight. Esay to pretend a disruptive behaviour on board in order to gain access to the cockpit during flight.

The definition of "Aircraft Search" is part of the EC Regulation nº 300/2008 and does not mean the same task as the present one. Therefore this procedure should be renamed in order to avoid misunderstanding.

comment

3942

comment by: SATA Group

- Under ECAC doc 30 and ICAO Tokyo Convention, a disruptive/unruly

passenger is someone who commits a disruptive/unruly act onboard an aircraft in flight. EASA in this NPA extends these acts to the areas out of the aircraft and also when the aircraft is not in flight.

- At the airport terminals, check-in counters, boarding gates, ramp, areas next to the aircraft, holds, etc, is under the responsibility of the airport or the police authorities, not to the aircraft operator.
- The operator should only be trained to inform the airport and the authorities in order to prevent these passengers from boarding into the aircraft.
- **Warning to passenger** shall be **signed** by the pilot in command. "**given**" is not an adequate word and it is confused, because the pilot in command can not physically give this warning to the disruptive passenger.
- **Categorizing of disruptive passengers incidents** - Operators are already using a security form for the report of disturbances provoked by the unruly/disruptive passengers on board, in basis of 3 levels ( not 4), under the requirements of ECAC Doc 30.
- **Location of restraint devices** - remove "such as the cockpit". Cockpit must remain secure. Is not the secure location for keeping the restraint devices. Flight deck doors shall be always closed and blocked, during all the time of the flight.

comment by: IATA

#### **P.123/4 GM OR.OPS.020.SEC Disruptive Passenger behaviour**

The term 'potentially disruptive passenger' in the context of Regulation (EC) 200/2008 means a "passenger who is a deportee, a person deemed to be inaccessible for immigration purposes or a person in lawful custody".

Although not defined in Regulation 216, it is clear that the term 'disruptive passenger' is used in a much wider context. This anomaly must be clarified and any confusion removed.

GM OR.OPS.020.SEC – Operators have already, on the basis of operational experience, invested heavily in the development of effective policy and procedures for handling disruptive passengers. These procedures may not require the use of "restraining devices onboard" or a "warning" system therefore references to both must be removed.

GM OR.OPS.020.SEC 2.1 should be amended as follows to ensure uniformity with GM OR.OPS.020.SEC 1

"The operator should inform all staff members" *that come in contact with passengers, both on the ground and in the air* "about the contents of..."

GM OR.OPS.020.SEC 2.2 – the operator is not the only entity with responsibility for passenger communication and education. This paragraph requires amendment to include State, Airport etc responsibilities in this area.

GM OR.OPS.020.SEC 3 – Operators have no responsibility for providing nicotine replacement therapy to passengers – this must be removed.

#### **P.124 GM OR.OPS.020.SEC Disruptive Passenger behaviour Para 3.1(b) The operator should 'Minimise passenger frustration that occurs over long waiting times, the flight being overbooked, lack of information, technical deficiencies, etc'**

This paragraph should be withdrawn as it implies that all these are all Air carriers fault and that these situations can definitively be resolved as they are under the direct control of airlines – other issues such as adverse weather,

airport congestion, industrial action, ATC delays, security screening procedures can all equally 'frustrate' passengers.

**P.124 GM OR.OPS.020.SEC Disruptive Passenger behaviour Para 3.1(d) – The operator should maintain accurate and up dated reports and statistics of disruptive passenger incidents so as to continually monitor the types of incidents and identify potential training needs etc.'**

This is also an airport security and police issue (many operators are not aware of incidents of disruption prior to boarding).

It is primarily a member state control authority issue to evaluate and analyse both mandatory and non mandatory reports.

Reference to restraints must also be removed (ref above comments)

**P.125 GM OR.OPS.020.SEC Disruptive Passenger Behaviour Para 4**

This must be removed. Operators have already, on the basis of operational experience, invested heavily in the development of effective policy and procedures for handling disruptive passengers. These procedures may not require the use of "restraining devices onboard" or a "warning" system therefore references to both must be removed.

**P.126 GM OR.OPS. 020.SEC Disruptive Passenger behaviour Para 6.1 Location of restraint devices – 'Should be kept in a secure location such as the cockpit'**

No mandate should be envisaged to carry restraints – they are not appropriate for all commercial aircraft types

Remove 'such as the cockpit' – As locked door policy is mandated OR.OPS.035.SEC cockpit must remain secure; terrorists could use simulated 'disruptive' behaviour in the knowledge this may open secure flight deck doors.

**P.126 GM OR.OPS.020.SEC Disruptive Passenger Behaviour Para 7.2 – Training Requirements**

To take account of operators who do not carry restraint devices onboard i. and j. should be amended as follows:

- i. restraint device training (if applicable)*
- j. restrained passenger welfare (if applicable)*

**p. 127 GM OR.OPS.020.SEC Disruptive Passenger Behaviour Para 8**

This would appear to refer to the Regulation (EC) 300/2008 definition. Any confusion, anomaly between the two Regulations must be removed. The term "persons travelling under special status" does not appear in any existing or draft security Legislation.

**P.127 GM OR.OPS.020.SEC Disruptive Passenger behaviour Para 9.1 Additional Guidance material in the handling of disruptive passengers**

All references to additional Guidance material are in ICAO and ECAC Restricted documents and are not routinely available to airlines.

These documents must be made available to all operators.

**P.129 Appendix 1 to GM OR.OPS.020.SEC**

As this form makes reference to a 'warning system' it should be removed.

**P.132 Appendix 3 to GM OR.OP S.020.SEC Disruptive P assenger behaviour**

Any reference to time allocation for training (e.g. 8 hours/½ day) is irrelevant and must be removed. Effective training is the goal.

comment 2317 comment by: Ryanair

Security training requirements are already specified in Regulation (EC) 300/2008, Chapter 11. This proposed AMC must take account of this.

c. Appropriate self-defence responses

Remove - ground personnel and crew should be trained in de-escalation techniques. Self defence type training is not appropriate.

d. Use of authorised protective devices

There is no definition of 'authorised protective devices'. The only reference is to 'restraining devices'. As previously stated operators have invested heavily in developing policy and procedures which may not require the use of

restraining devices. Nothing in these Regulations/AMCs/GM should be interpreted as mandating the use of restraining devices.

h. Aircraft search procedures and guidance on least-risk bomb location where practicable

Aircraft check and search requirements are already specified in and mandated by Regulation (EC) 300/2008.

comment

2683

comment by: Ryanair

Comment

The content and thrust of this sample training program is entirely inappropriate and misconceived. Required Training should be included in Security Training as specified and mandated by Regulation (EC) 300/2008, Chapter 11. Training requirements should be operator defined based on their experience of disruptive passengers and their existing procedures. All training for cabin crew should be aimed at increasing de-escalation techniques that do not involve physical contact with a disruptive passenger. Self defence type training is not appropriate. The emphasis placed on the capability to use acquired knowledge in practical cases is laughable. Are operators expected to have kung fu experts as cabin crew so that an 8 stone girl can overpower a drunken football supporter? If such skills are to be deployed on an aircraft it is not for the operator to train and supply them.

Question

Why is there a difference between Appendix 3 and the content of AMC.OR.OPS.025.SEC? Surely the appendix should satisfy the requirements of the AMC?

comment

2322

comment by: *Ryanair*

GM OR.OPS.025.SEC makes no reference to Regulation (EC) 300/2008.

The reference material specified is classified as 'restricted' and therefore may not be available to all operators.

Regulation (EC) 300/2008 already requires Operators to develop and implement a security programme. To avoid conflict, any reference to an operators security programme or a requirement to include elements of this programme in the operations manual must be removed. Otherwise operators may be subjected to duplicated information and approval processes.

Some of the proposed information in this GM already conflicts with the Requirements of Regulation (EC) 300/2008, is unnecessary and must be removed. For example:

(c)(b)

- The incorrect limitation of pre-employment screening to flight operations department personnel [(b)(i)]
- A requirement for crew members display photo ID at all times [(b)(ii)]
- Conflicting list of areas of the aircraft to be security checked/searched [(c)(i)]
- Requirements for 'unattended aircraft' conflict Regulation (EC) 300/2008 [(c)(iv)]
- 300/2008 does not mandate the use of aircraft seals [(c)(v)]
- Airport requirements [(c)(d)] etc, etc

Due to the level of inconsistency and conflict with existing Security Legislation this GM should be removed in it's entirety.

There is no reference to Regulation (EC) 300/2008

Security training requirements are already specified in and mandated by Regulation (EC) 300/2008, Chapter 11. Nothing in OR.OPS, Section IX shall conflict with these requirements.

All references are to restricted ICAO and ECAC documents which are not readily accessible to all operators.

Aircraft security check and search requirements are already specified in and mandated by Regulation (EC) 300/2008. There is no basis in security for an aircraft search procedures checklist nor does it add any benefit. OR.OPS SEC must be amended to reflect the Requirements of Regulation (EC) 300/2008.

"Trade organisations" have no role in aviation regulation therefore all references to such organisations must be removed.

**P136 GM OR.OPS.030.SEC Aircraft search procedure checklist**  
**Association comment**

This should be renamed 'Specific threat event – search procedure checklist' in order to not be confused by Aircraft search procedures that are already mandated in Chapter 3 of EU300/2008 – Section should be amended to reflect this.

P136 GM OR.OPS.030.SEC Aircraft search procedure checklist

There is no basis in security for such a checklist nor does it serve any security benefit. Aircraft search procedures are specified in and mandated by Chapter 3 of EU300/2008 – Section IX of OR.OPS should be amended to reflect this

This paragraph has no delimitation to the aircraft security check/search as per Regulation (EC) 300/2008. This might end up in confusion of involved personnel.  
This should be renamed in order to not be confused by aircraft search procedures that are already mandated in Chapter 3 of Regulation (EC) 300/2008. The Section should be amended to reflect this.

comment by: *Antonio Sousa*

The definition "Aircraft Search" is part of the EC Regulation n.º 300/2008 and does not mean the same task as the present one. Therefore this procedure should be renamed in order to avoid misunderstanding.

- **Aircraft search procedure checklist** - should be **renamed**, because can do confusion with the aircraft search procedures mandated in chapter 3 of EU 300/2008
